- F. spiramycin dimer.

SPIRAPRIL HYDROCHLORIDE MONOHYDRATE

Spirapril hydrochloridum monohydricum

 $C_{22}H_{31}ClN_2O_5S_2 \cdot H_2O$ M_r 521.1

DEFINITION

(8*S*)-7-[(2*S*)-2-[[[(1*S*)-1-(Ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]-1,4-dithia-7-azaspiro[4.4]nonane-8-carboxylic acid hydrochloride monohydrate.

Content: 97.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, fine crystalline powder.

Solubility: very slightly soluble in water, soluble in methanol, slightly soluble in acetonitrile, practically insoluble in methylene chloride.

IDENTIFICATION

A. Specific optical rotation (see Tests).

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs of potassium bromide *R*.

Comparison: spirapril hydrochloride monohydrate CRS.

C. It gives the reactions of chlorides (2.3.1).

TESTS

Specific optical rotation (2.2.7): -11.0 to -13.0 (anhydrous substance).

Dissolve 0.200 g in dimethylformamide *R* and dilute to 20.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Solvent mixture: acetonitrile *R1*, water *R* (2:8 V/V).

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution (a). Dissolve 6.0 mg of spirapril for system suitability CRS (spirapril spiked with impurity B and impurity D) in the solvent mixture and dilute to 20 ml with the solvent mixture.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 5.0 ml of this solution to 50.0 ml with the solvent mixture.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10.0 ml with the solvent mixture.

Column:

- *size*: $l = 0.125$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 μ m),
- *temperature*: 70 °C.

Mobile phase:

- **mobile phase A:** dissolve 4.5 g of *tetramethylammonium hydroxide R* in 900 ml of *water R*, add 100 ml of *acetonitrile R1* and adjust to pH 2.2 with *phosphoric acid R*,
- **mobile phase B:** dissolve 4.5 g of *tetramethylammonium hydroxide R* in 400 ml of *water R*, add 600 ml of *acetonitrile R1* and adjust to pH 2.2 with *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 4	90	10
4 - 14	90 → 10	10 → 90
14 - 20	10	90
20 - 23	10 → 90	90 → 10
23 - 33	90	10

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Relative retention with reference to spirapril (retention time = about 10 min): impurity C = about 0.6; impurity B = about 0.7; impurity A = about 1.26; impurity D = about 1.38.

System suitability: reference solution (a):

- **resolution:** minimum 3.5 between the peaks due to impurity B and spirapril, and minimum 5.5 between the peaks due to spirapril and impurity D.

Limits:

- **impurities A, C:** for each impurity, not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **impurity B:** not more than 0.6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- **impurity D:** not more than 0.8 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
- **any other impurity:** for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent); disregard any peak due to the blank (solvent mixture).

Water (2.5.12): 3.0 per cent to 4.0 per cent, determined on 0.200 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29).

Solvent mixture. Mix equal volumes of *acetonitrile R1* and *water R*.

Test solution. Dissolve 20.0 mg of the substance to be examined in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (a). Dissolve 20.0 mg of *spirapril hydrochloride monohydrate CRS* in the solvent mixture and dilute to 100.0 ml with the solvent mixture.

Reference solution (b). Dissolve 6.0 mg of *spirapril for system suitability CRS* (spirapril spiked with impurity B and impurity D) in a mixture of 2 volumes of *acetonitrile R* and 8 volumes of *water R* and dilute to 20 ml with the same mixture of solvents.

Solution A. Dissolve 4.5 g of *tetramethylammonium hydroxide R* in 900 ml of *water R*, adjust to pH 1.75 with *phosphoric acid R* and add 100 ml of *acetonitrile R1*.

Solution B. Dissolve 4.5 g of *tetramethylammonium hydroxide R* in 400 ml of *water R*, adjust to pH 1.75 with *phosphoric acid R* and add 600 ml of *acetonitrile R1*.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography R (5 µm),
- **temperature:** 70 °C.

Mobile phase: solution A, solution B (45:55 V/V).

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Retention time: spirapril = 1.6 min to 2.9 min; impurity D = about 13 min. Adjust the proportion of solution B in the mobile phase if necessary.

System suitability: reference solution (b):

- **resolution:** minimum 15 between the peaks due to spirapril and impurity D.

Calculate the percentage content of $C_{22}H_{31}ClN_2O_5S_2$ from the chromatograms obtained with the test solution and reference solution (a) and the declared content of *spirapril hydrochloride monohydrate CRS*.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D.

A. ethyl (2S)-2-[(3'S,8'aS)-3'-methyl-1',4'-dioxo-hexahydrospiro[1,3-dithiolane-2,7'-(6'H)-pyrrolo[1,2-a]pyrazin]-2'-yl]-4-phenylbutanoate,

- B. $R_1 = R_2 = H$: (8*S*)-7-[(2*S*)-2-[(1*S*)-1-carboxy-3-phenylpropyl]amino]propanoyl]-1,4-dithia-7-azaspiro[4.4]nonane-8-carboxylic acid (spiraprilat),
- D. $R_1 = C_2H_5$, $R_2 = CH(CH_3)_2$: 1-methylethyl (8*S*)-7-[(2*S*)-2-[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoyl]-1,4-dithia-7-azaspiro[4.4]nonane-8-carboxylate,

- C. (2*S*)-2-[(1*S*)-1-(ethoxycarbonyl)-3-phenylpropyl]amino]propanoic acid.

01/2005:0688

SPIRONOLACTONE

Spironolactonum

 $C_{24}H_{32}O_4S$ M_r 416.6

DEFINITION

Spironolactone contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 7 α -(acetylsulfanyl)-3',4'-dihydrospiro[androst-4-ene-17, 2'(5'*H*)-furan]-3,5'-dione, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *spironolactone CRS*. Examine the substances as 50 g/l solutions in *chloroform R*.

- B. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 20 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20 mg of *spironolactone CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 μ l of each solution.

Develop over a path of 15 cm using a mixture of 1 volume of *water R*, 24 volumes of *cyclohexane R* and 75 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

- C. To about 10 mg add 2 ml of a 50 per cent V/V solution of *sulphuric acid R* and shake. An orange solution with an intense yellowish-green fluorescence is produced. Heat the solution gently; the colour becomes deep red and hydrogen sulphide, which blackens *lead acetate paper R*, is evolved. Add the solution to 10 ml of *water R*; a greenish-yellow solution is produced which shows opalescence or a precipitate.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.100 g in *chloroform R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is -33 to -37 , calculated with reference to the dried substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 62.5 mg of the substance to be examined in 2.5 ml of *tetrahydrofuran R* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 25.0 mg of *canrenone CRS* in 1 ml of *tetrahydrofuran R* and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). Mix 1 ml of the test solution with 1 ml of reference solution (b) and dilute to 100 ml with the mobile phase.

Reference solution (e). Dilute 0.50 ml of reference solution (a) to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 μ m),
- a mixture of 8 volumes of *acetonitrile R*, 18 volumes of *tetrahydrofuran R* and 74 volumes of *water R* as the mobile phase at a flow rate of 1.8 ml/min,
- a variable wavelength spectrophotometer capable of operating at 254 nm and at 283 nm as detector.

Inject separately 20 μ l of the test solution and 20 μ l of reference solution (a), 20 μ l of reference solution (d) and 20 μ l of reference solution (e) and record the chromatograms with the detector set for recording at 254 nm. Continue the chromatography for twice the retention time of spironolactone. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, except those corresponding to spironolactone and canrenone, is not greater than the area of the peak corresponding to spironolactone in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak whose area is less than that of the principal peak in the chromatogram obtained with reference solution (e) (0.05 per cent). Inject 20 μ l of the test solution and 20 μ l of reference solution (c) and record the chromatogram with the detector

set for recording at 283 nm. In the chromatogram obtained with the test solution, the area of any peak corresponding to canrenone is not greater than the area of the peak corresponding to canrenone in the chromatogram obtained with reference solution (c) (1.0 per cent). Calculate the percentage content of canrenone found when recording at 283 nm and the percentage content of the other related substances found when recording at 254 nm. Add together these percentages. The sum is not greater than 1.0 per cent. The test is not valid unless: the chromatogram obtained with reference solution (d) shows peaks, corresponding to canrenone and spironolactone, with a resolution greater than 1.4; the principal peak in the chromatogram obtained with reference solution (e) has a signal-to-noise ratio of at least 6.

Free mercapto compounds. To 2.0 g add 20 ml of *water R*, shake for 1 min and filter. To 10 ml of the filtrate add 0.05 ml of 0.01 M iodine and 0.1 ml of *starch solution R* and mix. A blue colour develops.

Chromium. To 0.20 g in a platinum crucible add 1 g of *potassium carbonate R* and 0.3 g of *potassium nitrate R*. Heat gently until fused, and ignite at 600 °C to 650 °C until carbon is removed. Cool, dissolve the residue as completely as possible in 10 ml of *water R* with the aid of gentle heat, filter, and dilute to 20 ml with *water R*. To 10 ml of this solution add 0.5 g of *urea R*, and add a 14 per cent V/V solution of *sulphuric acid R* until the solution is just acid. When effervescence ceases, add a further 1 ml of the sulphuric acid, dilute to 20 ml with *water R* and add 0.5 ml of *diphenylcarbazide solution R*. The solution is not more intensely coloured than a standard prepared by adding 1 ml of a 14 per cent V/V solution of *sulphuric acid R* to 0.50 ml of a freshly prepared 28.3 mg/l solution of *potassium dichromate R*, diluting to 20 ml with *water R* and adding 0.5 ml of *diphenylcarbazide solution R* (50 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 50.0 mg in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 5.0 ml of this solution to 100.0 ml with *methanol R*. Measure the absorbance (2.2.25) of the solution at the maximum at 238 nm.

Calculate the content of $C_{30}H_{62}O_4S$, taking the specific absorbance to be 470.

STORAGE

Store protected from light.

DEFINITION

2,6,10,15,19,23-Hexamethyltetracosane (perhydrosqualene). It may be of vegetable (unsaponifiable matter of olive oil) or animal (shark liver oil) origin.

Content: 96.0 per cent to 103.0 per cent.

CHARACTERS

Appearance: clear, colourless, oily liquid.

Solubility: practically insoluble in water, miscible with most fats and oils, freely soluble in acetone and in cyclohexane, practically insoluble in alcohol.

Relative density: about 0.815.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *squalane CRS*.

B. It complies with the test for refractive index (see Tests).

C. Examine the chromatograms obtained in the assay.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

The chromatogram obtained with squalane of vegetable origin shows a peak corresponding to cyclosqualane (Figure 1630-1 and Figure 1630-2).

TESTS

Appearance. The substance to be examined is clear (2.2.1) and colourless (2.2.2, *Method II*).

Refractive index (2.2.6): 1.450 to 1.454.

Acid value (2.5.1): maximum 0.2.

Iodine value (2.5.4): maximum 4.0.

Saponification value (2.5.6): maximum 3.0.

Nickel (2.4.27): maximum 1 ppm.

Total ash (2.4.16): maximum 0.5 per cent, determined on 1.000 g.

ASSAY

Gas chromatography (2.2.28).

Internal standard solution. To 1.0 ml of *dimethylacetamide R*, add 100.0 ml of *heptane R*.

Test solution. Dissolve 0.100 g in the internal standard solution and dilute to 25.0 ml with the same solution.

Reference solution (a). Dissolve 0.100 g of *squalane CRS* in the internal standard solution and dilute to 25.0 ml with the same solution.

Reference solution (b). To 0.1 ml of *methyl erucate R* add 0.100 g of the substance to be examined, dissolve in the internal standard solution and dilute to 25.0 ml with the same solution.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** *poly(dimethyl)siloxane R* (film thickness 1 μ m).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.7 ml/min.

Split ratio: 1:12.

01/2005:1630

SQUALANE

Squalanum

$C_{30}H_{62}$

M_r 422.8

Figure 1630.-1. – Chromatogram of squalane of animal origin

Figure 1630.-2. – Chromatogram of squalane of vegetable origin

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 39	60 - 290
	39 - 50	290
Injection port		275
Detector		300

Detection: flame ionisation.

Injection: 1 µl.

Relative retentions with reference to squalane (retention time = about 41 min): internal standard = about 0.2; methyl erucate = about 0.9; cyclosqualane = 1.05.

System suitability: reference solution (b):

- *resolution:* minimum 5 between the peaks due to methyl erucate and squalane.

Calculate the percentage content of squalane from the areas of the peaks and the declared content of *squalane CRS*.

LABELLING

The label states the origin of squalane (vegetable or animal).

01/2005:1438

St. JOHN'S WORT

Hyperici herba

DEFINITION

St. John's wort consists of the whole or cut, dried flowering tops of *Hypericum perforatum* L., harvested during flowering time. It contains not less than 0.08 per cent of total hypericins expressed as hypericin ($C_{30}H_{16}O_8$; M_r 504.4), calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- The branched and bare stem shows 2 more-or-less prominent longitudinal ridges. The leaves are opposite, sessile, exstipulate, oblong-oval and 15 mm to 30 mm long; present on the leaf margins are glands which appear as black dots and over all the surface of the leaves many small, strongly translucent excretory glands which are visible in transmitted light. The flowers are regular and form corymbose clusters at the apex of the stem. They have 5 green, acute sepals, with black secretory glands on the margins; 5 orange-yellow petals, also with black secretory glands on the margins; 3 staminal blades, each divided into many orange-yellow stamens and 3 carpels surmounted by red styles.
- Reduce to a powder (355). The powder is greenish-yellow. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of polygonal cells of the epidermis with thickened and beaded walls and paracytic or anomocytic stomata (2.8.3); fragments of the leaf and sepal with large oil glands and red pigment cells; thin-walled, elongated cells of the petal epidermis with straight or wavy anticlinal walls; tracheids and tracheidal

vessels with pitted walls and groups of thick-walled fibres; fragments of rectangular, lignified and pitted parenchyma; fibrous layer of the anther and elongated, thin-walled cells of the filament with a striated cuticle; numerous pollen grains with 3 pores and a smooth exine, occur singly or in dense groups, and calcium oxalate cluster crystals.

- Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Stir 0.5 g of the powdered drug (500) in 10 ml of *methanol R* in a water-bath at 60 °C for 10 min and filter.

Reference solution. Dissolve 5 mg of *rutin R* and 5 mg of *hyperoside R* in *methanol R* and dilute to 5 ml with the same solvent.

Apply to the plate as 10 mm bands 10 µl of the test solution and 5 µl of the reference solution. Develop over a path of 10 cm using a mixture of 6 volumes of *anhydrous formic acid R*, 9 volumes of *water R* and 90 volumes of *ethyl acetate R*. Allow the plate to dry at 100-105 °C for 10 min. Spray the plate with a 10 g/l solution of *diphenylboric acid aminoethyl ester R* in *methanol R* and then with a 50 g/l solution of *macrogol 400 R* in *methanol R*. Examine the plate after about 30 min in ultraviolet light at 365 nm. The chromatogram obtained with the reference solution shows in the lower third the zone due to rutin and above it the zone due to hyperoside, both with yellow-orange fluorescence. The chromatogram obtained with the test solution shows in the lower third the reddish-orange fluorescent zones of rutin and hyperoside and in the lower part of the upper third the zone of pseudohypericin and above it the zone of hypericin, both with red fluorescence. Other yellow or blue fluorescent zones are visible.

TESTS

Foreign matter (2.8.2). Not more than 3 per cent of stems with a diameter greater than 5 mm, and not more than 2 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of the powdered drug (500) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16). Not more than 7.0 per cent.

ASSAY

Test solution. In a 100 ml round-bottomed flask, introduce 0.800 g of the powdered drug (500), 60 ml of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R* and a magnetic stirrer. Boil the mixture in a water-bath at 70 °C under a reflux condenser for 30 min. Centrifuge (2 min at 700 g) and decant the supernatant into a 250 ml flask. Take up the residue with 60 ml of a mixture of 20 volumes of *water R* and 80 volumes of *tetrahydrofuran R*. Heat again under a reflux condenser for 30 min. Centrifuge (2 min at 700 g) and decant the supernatant. Combine the extracts and evaporate to dryness. Take up the residue with 15 ml of *methanol R* with the help of ultrasound and transfer to a 25 ml measuring flask. Rinse the 250 ml flask with *methanol R* and dilute to 25.0 ml with the same solvent. Centrifuge again, filter 10 ml through a syringe filter (0.2 µm). Discard the first 2 millilitres of the filtrate. Introduce 5.0 ml of the filtrate into a measuring flask and dilute to 25.0 ml with *methanol R*.

Compensation liquid. *Methanol R*.

Measure the absorbance (2.2.25) of the test solution at 590 nm by comparison with the compensation liquid.

Calculate the percentage content of total hypericins, expressed as hypericin, from the expression:

$$\frac{A \times 125}{m \times 870}$$

i.e. taking the specific absorbance of hypericin to be 870.

A = absorbance at 590 nm,

m = mass of the drug to be examined, in grams.

STORAGE

Protected from light.

STANNOUS CHLORIDE DIHYDRATE

Stannosi chloridum dihydricum

$\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$

M_r 225.6

DEFINITION

Stannous chloride dihydrate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$.

CHARACTERS

A white, crystalline powder or colourless crystals, efflorescent in air, freely soluble in water (the solution becomes cloudy after standing or on dilution), freely soluble in alcohol. It dissolves in dilute hydrochloric acid.

IDENTIFICATION

- To 1 ml of solution S1 (see Tests) add a mixture of 5 ml of *water R* and 0.05 ml of *mercuric chloride solution R*. A blackish-grey precipitate forms.
- Dissolve 1.0 g in 3.0 ml of *water R*. Add 0.5 ml of *dilute sodium hydroxide solution R* to the cloudy solution; a yellowish flocculent precipitate is formed. Add 6.5 ml of *water R*. To 1.0 ml of the previously shaken suspension add 1.0 ml of *strong sodium hydroxide solution R*; the precipitate dissolves and the resulting solution is clear and colourless.
- Dissolve 10 mg in 2 ml of *dilute nitric acid R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S1. To 0.40 g add 1 ml of *dilute hydrochloric acid R* and dilute to 20 ml with *distilled water R*.

Solution S2. Dissolve 1.0 g in *dilute hydrochloric acid R* and dilute to 30 ml with the same acid. Heat to boiling. Add 30 ml of *thioacetamide solution R* and boil for 15 min (solution A). Use 5 ml, filter and heat the filtrate to boiling. Add 5 ml of *thioacetamide solution R* and boil for 15 min. If a precipitate is formed, add the remainder of solution A (solution A') to the mixture. Add 10 ml of *thioacetamide solution R* and boil. Repeat the series of operations from "Use 5 ml,..." until a precipitate is no longer formed on addition of *thioacetamide solution R* to the filtrate obtained from the 5 ml of solution A (solution A', solution A'',..., respectively). If no precipitate is formed or if no more precipitate is formed combine the solution obtained with the remainder of solution A (solution A', solution A'',..., respectively), filter and wash the precipitate with 10 ml of *water R*. Heat the filtrate until the resulting vapour no longer turns a moistened piece of *lead acetate paper R* blackish-grey. Allow to cool and dilute to 50 ml with *water R*.

Appearance of solution. Dissolve 10.0 g in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Substances not precipitated by thioacetamide. Evaporate 25 ml of solution S2 to dryness and ignite at 600 °C. The residue weighs not more than 1 mg (0.2 per cent).

Sulphates (2.4.13). 15 ml of solution S1 complies with the limit test for sulphates (500 ppm).

Iron (2.4.9). Dilute 5 ml of solution S2 to 10 ml with *water R*. The solution complies with the limit test for iron (100 ppm).

Heavy metals. Dissolve 1.0 g in 2 ml of a mixture of 1 volume of *nitric acid R* and 3 volumes of *hydrochloric acid R*. Heat the solution on a water-bath until nitrous vapour is no longer evolved. Dissolve the residue in *water R* and dilute to 25 ml with the same solvent. To 5 ml of the solution add 3 ml of *strong sodium hydroxide solution R* and 2 ml of *water R*. Heat until a clear solution is obtained, then cool and add 0.5 ml of *thioacetamide reagent R*. After 2 min, any colour in the solution is not more intense than that of a mixture of 1.0 ml of *lead standard solution (10 ppm Pb) R*, 6 ml of *water R*, 3 ml of *strong sodium hydroxide solution R* and 0.5 ml of *thioacetamide reagent R* (50 ppm).

ASSAY

Dissolve 0.100 g in 1.5 ml of *hydrochloric acid R1* and dilute to 50 ml with *water R*. Add 5 g of *sodium potassium tartrate R*, 10 g of *sodium hydrogen carbonate R* and 1 ml of *starch solution R*. Titrate immediately with 0.05 M *iodine*. Carry out a blank titration.

1 ml of 0.05 M *iodine* is equivalent to 11.28 mg of $\text{SnCl}_2 \cdot 2\text{H}_2\text{O}$.

STORAGE

Store in an airtight container.

01/2005:1568

STANOZOLOL

Stanozololum

$\text{C}_{21}\text{H}_{32}\text{N}_2\text{O}$

M_r 328.5

DEFINITION

Stanozolol contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of 17-methyl-2'H-5α-androst-2-eno[3,2-c]pyrazol-17β-ol, calculated with reference to the dried substance.

CHARACTERS

A white or almost white crystalline powder, hygroscopic, practically insoluble in water, soluble in dimethylformamide, slightly soluble in alcohol, very slightly soluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

- Examine by infrared spectrophotometry (2.2.24), comparing with the spectrum obtained with *stanozolol CRS*. If the spectra obtained in the solid

state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of methylene chloride, evaporate to dryness at room temperature under an air-stream and record new spectra using the residues.

- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (c).

TESTS

Specific optical rotation (2.2.7). Dissolve 0.10 g in *chloroform R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 34 to + 40, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (a). Dilute 1.0 ml of test solution (a) to 200 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). Dissolve 5 mg of *stanazolol impurity A CRS* in reference solution (a) and dilute to 50 ml with the same solution.

Reference solution (c). Dissolve 10 mg of *stanazolol CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 5 ml with the same mixture of solvents.

Apply to the plate 5 µl of each solution. Develop over a path corresponding to two thirds of the plate height using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air, spray with *alcoholic solution of sulphuric acid R*, heat at 105 °C for 15 min and examine under ultraviolet light at 365 nm. Any secondary spot in the chromatogram obtained with test solution (a) is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying at 100 °C at a pressure not exceeding 0.7 kPa.

ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 32.85 mg of C₂₁H₃₂N₂O.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. R = H₂: 17β-hydroxy-17-methyl-5α-androstan-3-one (mestanolone),
 B. R = CH-OH: 17β-hydroxy-2-(hydroxymethylene)-17-methyl-5α-androstan-3-one (oxymetholone).

01/2005:1153

STAR ANISE

Anisi stellati fructus

DEFINITION

Dried composite fruit of *Illicium verum* Hooker fil.

Content: minimum 70 ml/kg of essential oil (anhydrous drug).

CHARACTERS

The fruit carpels are brown.

Odour of anethole.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The fruit consists of 6 to 11 (usually 8), often unequally developed, boat-shaped follicles, each 12 mm to 20 mm long and 6 mm to 11 mm thick, radially arranged around a short, central, blunt-ending columella. The follicles are bluntly peaked at the apex, flat at the base and the outer surface is greyish-brown, roughly wrinkled. The ventral suture is frequently open exposing a single, hard, ovoid, laterally compressed, shiny, reddish-brown seed about 8 mm long. The pedicel, if present, is distinctly curved and thickened at the apex. Separated follicles and seeds may be present.
- B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: brown epicarpal cells, polygonal in surface view, with strongly striated cuticles and occasional anomocytic stomata (2.8.3); fragments of the endocarp with palisade-like cells up to about 600 µm long; fragments of the mesocarp with large parenchymatous cells, vessels, oil-containing cells and groups of large very elongated stone cells with thickened and pitted walls; fragments of the testa with palisade-like, yellow stone cells up to 200 µm long, with strongly pitted walls; fragments of the endosperm containing droplets of oil and aleurone grains; fragments of the columella and the fruit stalk with strongly thickened irregular stone cells up to 400 µm long and about 150 µm wide, with pointed, star-shaped projections (astrosclereids); rhomboidal or rectangular crystals of calcium oxalate.

- C. Thin-layer chromatography (2.2.27).

Test solution. Shake 0.20 g of the freshly powdered drug (710) with 2.0 ml of *toluene R* for 15 min and filter.

Reference solution. Dissolve 3 µl of *anethole R* and 20 µl of *olive oil R* in 1 ml of *toluene R*.

Plate: *TLC silica gel plate R*.

Mobile phase: toluene R.

Application: 20 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 120 °C for 5 min and examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other weaker zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
_____	_____
Anethole: a reddish-violet zone	A reddish-violet zone (anethole)
_____	_____
Triglycerides of olive oil: a bluish-violet zone	A bluish-violet zone
Reference solution	Test solution

TESTS

***Illicium anisatum* (= *I. religiosum*).** The fruit must not contain follicles with an upwardly turned beak nor straight fruit stalks that are not curved at the distal end. Fragments of the endocarp with palisade-like cells less than about 360 µm long and fragments of the columella, previously separated from the fruit, with strongly thickened rounded stone cells without star-shaped projections must be absent.

Foreign matter (2.8.2): maximum 2 per cent.

Water (2.2.13): maximum 100 ml/kg, determined by distillation on 20.0 g of the powdered drug (710).

Total ash (2.4.16): maximum 4.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 250 ml round-bottomed flask and 100 ml of *water R* as the distillation liquid. Immediately before the determination, reduce 50.0 g of the drug to a coarse powder (1400) and mix. Further reduce about 10.0 g of this mixture to a finer powder (710). Use 2.50 g of the powder for the determination. Introduce 0.50 ml of *xylene R* into the graduated tube. Distil at a rate of 2-3 ml/min for 2 h.

01/2005:2108
corrected

STAR ANISE OIL

Anisi stellati aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the dry ripe fruits of *Illicium verum* Hook. fil.

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 1 g of the substance to be examined in *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 µl of *linalol R*, 30 µl of *anisaldehyde R* and 200 µl of *anethole R* and in *toluene R* and dilute to 15 ml with the same solvent. Dilute 1 ml of this solution to 5 ml with *toluene R*.

Plate: TLC silica gel F₂₅₄ plate R.

Mobile phase: ethyl acetate R, toluene R (7:93 V/V).

Application: 5 µl as bands of 10 mm (for normal TLC plates) or 2 µl as bands of 10 mm (for fine particle TLC plates).

Development: over a path of 15 cm (for normal TLC plates) or over a path of 6 cm (for fine particle size plates).

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
_____	_____
Anethole: a quenching zone	A quenching zone, partly separated
_____	_____
Anisaldehyde: a quenching zone	A very strong quenching zone (anethole)
_____	_____
	A quenching zone (anisaldehyde)
Reference solution	Test solution

Detection B: spray with *methyl 4-acetylbenzoate reagent R* and heat at 100-105 °C for 10 min; examine the still hot plate in daylight within 10 min.

Results B: see below the sequence of zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
_____	_____
Anethole: a brown zone	A violet-brown zone, not fully separated
_____	_____
Anisaldehyde: a yellow zone	A very strong brown zone (anethole)
_____	_____
Linalol: a grey zone	A yellow zone (anisaldehyde)

	A grey zone (linalol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.979 to 0.985.

Refractive index (2.2.6): 1.553 to 1.556.

Freezing point (2.2.18): 15 °C to 19 °C.

Figure 2108.-1. – Chromatogram for the test for chromatographic profile of star anise oil

Fenchone. Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

Test solution. Dissolve 400 µl of the substance to be examined in 2.0 ml of *hexane R*.

Reference solution (a). Dilute 10 µl of *fenchone R* to 1.2 g with *hexane R*.

Reference solution (b). Dilute 100 µl of reference solution (a) to 100 ml with *hexane R*.

System suitability: reference solution (b):

– *signal-to-noise ratio*: minimum 10 for the principal peak.

Limit:

– *fenchone*: maximum 0.01 per cent.

Pseudoisoeugenyl 2-methylbutyrate. Gas chromatography (2.2.28) as described in the test for chromatographic profile with the following modifications.

Test solution. The substance to be examined.

Reference solution (a). Dilute 10 mg of the test solution to 1.000 g with *hexane R*. Dilute 0.5 ml of this solution to 100 ml with *hexane R*.

Reference solution (b). *Pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

System suitability:

– the chromatogram obtained with reference solution (b) is similar to the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

– *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (a).

Limit: locate the peak due to pseudoisoeugenyl 2-methylbutyrate by comparison with the chromatogram provided with *pseudoisoeugenyl 2-methylbutyrate for peak identification CRS*.

– *pseudoisoeugenyl 2-methylbutyrate*: maximum 0.01 per cent.

Fatty oils and resinified essential oils (2.8.7). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 200 µl of the substance to be examined in 1.0 ml of *hexane R*.

Reference solution. To 1.0 ml of *hexane R*, add 20 µl of *linalol R*, 20 µl of *estragole R*, 20 µl of *α-terpineol R*, 60 µl of *anethole R* and 30 µl of *anisaldehyde R*.

Column:

– *material*: fused silica,

– *size*: $l = 30$ m, $\varnothing = 0.25$ mm,

– *stationary phase*: *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	60
	5 - 80	60 → 210
	80 - 95	210
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution; record the retention times of these substances.

System suitability: reference solution:

- **resolution:** minimum 1.5 between the peaks due to estragole and α -terpineol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution and locate *cis*-anethole and foeniculin using the chromatogram shown in Figure 2108.-1 (disregard any peak due to hexane).

Determine the percentage content of these components. The percentages are within the following ranges:

- **linalol:** 0.2 per cent to 2.5 per cent,
- **estragole:** 0.5 per cent to 6.0 per cent,
- **α -terpineol:** less than 0.3 per cent,
- ***cis*-anethole:** 0.1 per cent to 0.5 per cent,
- ***trans*-anethole:** 86 per cent to 93 per cent,
- **anisaldehyde:** 0.1 per cent to 0.5 per cent,
- **foeniculin:** 0.1 per cent to 3.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

01/2005:1267

STARCH, PREGELATINISED

Amylum pregelificatum

DEFINITION

Pregelatinised starch is prepared from *Maize starch* (0344), *Potato starch* (0355) or *Rice starch* (0349) by mechanical processing in the presence of water, with or without heat, to rupture all or part of the starch granules and subsequent drying. It contains no added substances but it may be modified to render it compressible and to improve its flow characteristics.

CHARACTERS

Appearance: white or yellowish-white powder.

It swells in cold water.

IDENTIFICATION

- Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R* it presents irregular, translucent, white or yellowish-white flakes or pieces with an uneven surface. Under polarised light (between crossed nicol prisms), starch granules with a distinct black cross intersecting at the hilum may be seen.
- Disperse 0.5 g in 2 ml of *water R* without heating and add 0.05 ml of *iodine solution R1*. A reddish-violet to blue colour is produced.

TESTS

pH (2.2.3): 4.5 to 7.0.

Progressively add 3.0 g to 100.0 ml of *carbon dioxide-free water R*, stirring continuously. Determine the pH when a homogeneous solution is obtained.

Oxidising substances (2.5.30). It complies with the test for oxidising substances. Use a mixture of equal volumes of *water R* and *methanol R* as solvent.

Sulphur dioxide (2.5.29): maximum 50 ppm.

Iron (2.4.9): maximum 20 ppm.

Dissolve the residue obtained in the test for sulphated ash in 20 ml of *dilute hydrochloric acid R*. Filter. 10 ml of the filtrate complies with the limit test for iron

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol R* and *water R*, not more than traces of matter other than starch granules are present.

Loss on drying (2.2.32): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 90 min.

Sulphated ash (2.4.14): maximum 0.6 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ bacteria and not more than 10² fungi per gram, determined by plate-count. It complies with the test for *Escherichia coli* (2.6.13).

LABELLING

The type of starch used as starting material is stated.

01/2005:1474

STEARIC ACID

Acidum stearicum

DEFINITION

Mixture consisting mainly of stearic acid (C₁₈H₃₆O₂; *M_r* 284.5) and palmitic acid (C₁₆H₃₂O₂; *M_r* 256.4) obtained from fats or oils of vegetable or animal origin.

Content:

Stearic acid 50	<i>Stearic acid:</i> 40.0 per cent to 60.0 per cent. <i>Sum of the contents of stearic and palmitic acids:</i> minimum 90.0 per cent.
Stearic acid 70	<i>Stearic acid:</i> 60.0 per cent to 80.0 per cent. <i>Sum of the contents of stearic and palmitic acids:</i> minimum 90.0 per cent.
Stearic acid 95	<i>Stearic acid:</i> minimum 90.0 per cent. <i>Sum of the contents of stearic and palmitic acids:</i> minimum 96.0 per cent.

CHARACTERS

Appearance: white, waxy, flaky crystals, white hard masses or white or yellowish-white powder.

Solubility: practically insoluble in water, soluble in alcohol and in light petroleum (50-70 °C).

IDENTIFICATION

- It complies with the test for freezing point (see Tests).
- Acid value (2.5.1): 194 to 212, determined on 0.1 g.
- Examine the chromatograms obtained in the assay.

Results: the retention times of the principal peaks in the chromatogram obtained with the test solution are approximately the same as those of the principal peaks in the chromatogram obtained with the reference solution.

TESTS

Appearance. Heat the substance to be examined to about 75 °C. The resulting liquid is not more intensely coloured than reference solution Y₇ or BY₇ (2.2.2, *Method I*).

Acidity. Melt 5.0 g, shake for 2 min with 10 ml of hot *carbon dioxide-free water R*, cool slowly and filter. To the filtrate add 0.05 ml of *methyl orange solution R*. No red colour develops.

Iodine value (2.5.4). See Table 1474.-1.

Freezing point (2.2.18). See Table 1474.-1.

01/2005:1268

Table 1474.-1.

Type	Iodine value	Freezing point (°C)
Stearic acid 50	maximum 4.0	53 - 59
Stearic acid 70	maximum 4.0	57 - 64
Stearic acid 95	maximum 1.5	64 - 69

Nickel (2.4.27): maximum 1 ppm.

ASSAY

Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. In a conical flask fitted with a reflux condenser, dissolve 0.100 g of the substance to be examined in 5 ml of *boron trifluoride-methanol solution R*. Boil under reflux for 10 min. Add 4.0 ml of *heptane R* through the condenser and boil again under reflux for 10 min. Allow to cool. Add 20 ml of a saturated solution of *sodium chloride R*. Shake and allow the layers to separate. Remove about 2 ml of the organic layer and dry it over 0.2 g of *anhydrous sodium sulphate R*. Dilute 1.0 ml of this solution to 10.0 ml with *heptane R*.

Reference solution. Prepare the reference solution in the same manner as the test solution using 50 mg of *palmitic acid R* and 50 mg of *stearic acid R* instead of the substance to be examined.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.32$ mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.5 μ m).

Carrier gas: *helium for chromatography R*.

Flow rate: 2.4 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	70
	2 - 36	70 → 240
	36 - 41	240
Injection port		220
Detector		260

Detection: flame ionisation.

Injection: 1 μ l.

Relative retention with reference to methyl stearate: methyl palmitate = about 0.88.

System suitability: reference solution:

- **resolution:** minimum 5.0 between the peaks due to methyl stearate and methyl palmitate.

LABELLING

The label states the type of stearic acid (50, 70, 95).

STEAROYL MACROGOLGLYCERIDES

Macrogolglyceridum stearates

DEFINITION

Stearoyl macrogolglycerides are mixtures of monoesters, diesters and triesters of glycerol and monoesters and diesters of macrogols with a mean relative molecular mass between 300 and 4000. They are obtained by partial alcoholysis of saturated oils containing mainly triglycerides of stearic acid using macrogol or by esterification of glycerol and macrogol with saturated fatty acids or by mixture of glycerol esters and condensates of ethylene oxide with the fatty acids of these hydrogenated oils. The hydroxyl value does not differ by more than 15 units from the nominal value. The saponification value does not differ by more than 10 units from the nominal value.

CHARACTERS

Pale yellow waxy solids, dispersible in warm water and in warm liquid paraffin, freely soluble in methylene chloride, soluble in warm ethanol.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *methylene chloride R* and dilute to 20 ml with the same solvent.

Apply to the plate 10 μ l of the test solution. Develop over a path of 15 cm using a mixture of 30 volumes of *hexane R* and 70 volumes of *ether R*. Allow the plate to dry in air. Spray with a 0.1 g/l solution of *rhodamine B R* in *alcohol R* and examine in ultraviolet light at 365 nm. The chromatogram shows a spot corresponding to triglycerides with an R_f value of about 0.9 (R_{st} 1) and spots corresponding to 1,3-diglycerides (R_{st} 0.7), to 1,2-diglycerides (R_{st} 0.6), to monoglycerides (R_{st} 0.1) and to esters of macrogol (R_{st} 0).

B. They comply with the test for hydroxyl value (see Tests).

C. They comply with the test for saponification value (see Tests).

D. They comply with the test for fatty acid composition (see Tests).

TESTS

Acid value (2.5.1). Not more than 2.0, determined on 2.0 g.

Hydroxyl value (2.5.3, Method A). Determined on 1.0 g, the hydroxyl value does not differ by more than 15 units from the nominal value.

Peroxide value (2.5.5). Not more than 6.0, determined on 2.0 g.

Saponification value (2.5.6). Determined on 2.0 g, the saponification value does not differ by more than 10 units from the nominal value.

Alkaline impurities. Into a test-tube introduce 5.0 g and carefully add a mixture, neutralised if necessary with 0.01 M *hydrochloric acid* or with 0.01 M *sodium hydroxide*, of 0.05 ml of a 0.4 g/l solution of *bromophenol blue R* in *alcohol R*, 0.3 ml of *water R* and 10 ml of *alcohol R*. Shake and allow to stand. Not more than 1.0 ml of 0.01 M *hydrochloric acid* is required to change the colour of the upper layer to yellow.

Free glycerol. Not more than 3.0 per cent. Dissolve 1.20 g in 25.0 ml of *methylene chloride R*. Heat if necessary. After cooling, add 100 ml of *water R*. Shake and add 25.0 ml of a 6 g/l solution of *periodic acid R*. Shake and allow to stand for 30 min. Add 40 ml of a 75 g/l solution of *potassium iodide R*. Allow to stand for 1 min. Add 1 ml of *starch solution R*. Titrate the iodine with 0.1 M *sodium thiosulphate*. Carry out a blank titration.

1 ml of 0.1 M *sodium thiosulphate* is equivalent to 2.3 mg of glycerol.

Composition of fatty acids (2.4.22, *Method A*). The constitutive fatty acid composition is the following:

- lauric acid: not more than 5.0 per cent,
- myristic acid: not more than 5.0 per cent,
- different nominal amounts of stearic acid and of palmitic acid. The sum of $C_{18}H_{36}O_2$ and $C_{16}H_{32}O_2$ is not less than 90.0 per cent.

Ethylene oxide and dioxan (2.4.25). Not more than 1 ppm of ethylene oxide and not more than 10 ppm of dioxan.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.0 g by the semi-micro determination of water using a mixture of 30 volumes of *anhydrous methanol R* and 70 volumes of *methylene chloride R* as solvent.

Total ash (2.4.16). Not more than 0.2 per cent, determined on 1.0 g.

LABELLING

The label states the nominal hydroxyl value, the nominal saponification value and the type of the macrogol used (mean relative molecular mass) or the number of ethylene oxide units per molecule (nominal value).

Hydroxyl value (2.5.3, *Method A*): 197 to 217.

Iodine value (2.5.4). Not more than 2.0, determined on 2.00 g dissolved in 25 ml of *chloroform R*, warming if necessary.

Saponification value (2.5.6). Not more than 2.0.

ASSAY

Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.100 g of the substance to be examined in *ethanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 0.100 g of *stearyl alcohol CRS* in *ethanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *cetyl alcohol CRS* in 4.5 ml of reference solution (a) and dilute to 5.0 ml with *ethanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 2 m long and 2 mm in internal diameter packed with *diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 220 °C, that of the injection port at 275 °C and that of the detector at 250 °C. Inject 2 µl of reference solution (b). The assay is not valid unless the resolution between the peaks corresponding to cetyl alcohol and stearyl alcohol is at least 4.0. Inject 2 µl of the test solution and 2 µl of reference solution (a). Calculate the percentage content of octadecanol using the normalisation procedure.

01/2005:0246

01/2005:0753

STEARYL ALCOHOL

Alcohol stearylicus

DEFINITION

Stearyl alcohol is a mixture of solid alcohols; it contains not less than 95.0 per cent of octadecanol ($C_{18}H_{38}O$; M_r 270.5).

CHARACTERS

White, unctuous flakes, granules or mass, practically insoluble in water, soluble in alcohol. When melted, it is miscible with fatty oils, with liquid paraffin and with melted wool fat.

IDENTIFICATION

Examine the chromatograms obtained in the Assay. The retention time and size of the principal peak in the chromatogram obtained with the test solution are approximately the same as those of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Appearance of solution. Dissolve 0.50 g in 20 ml of *alcohol R* by heating to boiling. Allow to cool. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

Melting point (2.2.14): 57 °C to 60 °C.

Acid value (2.5.1). Not more than 1.0.

STRAMONIUM LEAF

Stramonii folium

DEFINITION

Stramonium leaf consists of the dried leaf or of the dried leaf, flowering tops and occasionally, fruit-bearing tops of *Datura stramonium* L. and its varieties. It contains not less than 0.25 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) with reference to the drug dried at 100 °C to 105 °C. The alkaloids consist mainly of hyoscyamine with varying proportions of hyoscyne (scopolamine).

CHARACTERS

Stramonium leaf has an unpleasant odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaves are dark brownish-green to dark greyish-green, often much twisted and shrunken during drying, thin and brittle, ovate or triangular-ovate, dentately lobed with an acuminate apex and often unequal at the base. Young leaves are pubescent on the veins, older leaves are nearly glabrous. Stems are green or purplish-green, slender, curved and twisted, wrinkled longitudinally and sometimes wrinkled transversely, branched dichasially, with a single flower or an immature fruit in the fork. Flowers, on short pedicels, have a gamosepalous calyx with 5 lobes and trumpet-shaped brownish-white or

purplish corolla. The fruit is a capsule, usually covered with numerous short, stiff emergences; seeds are brown to black with a minutely pitted testa.

- B. Reduce to a powder (355). The powder is greyish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) (2.8.3); covering trichomes are conical, uniseriate with 3 to 5 cells and warty walls; glandular trichomes are short and clavate with heads formed by 2 to 7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered drug may also show the following: fibres and reticulately thickened vessels from the stem; subspherical pollen grains usually about 60 µm to 80 µm in diameter with 3 germinal pores and nearly smooth exine; fragments of the corolla with papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate.
- C. Examine the chromatograms obtained in the chromatography test. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.
- D. Shake 1 g of the powdered drug (180) with 10 ml of 0.05 M *sulphuric acid* for 2 min. Filter and add to the filtrate 1 ml of *concentrated ammonia R* and 5 ml of *water R*. Shake cautiously with 15 ml of *peroxide-free ether R* to avoid the formation of an emulsion. Separate the ether layer and dry over *anhydrous sodium sulphate R*. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of *nitric acid R* and evaporate to dryness on a water-bath. Add 10 ml of *acetone R* and, dropwise, a 30 g/l solution of *potassium hydroxide R* in *alcohol R*. A deep violet colour develops.

TESTS

Chromatography. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. To 1.0 g of the powdered drug (180) add 10 ml of 0.05 M *sulphuric acid*, shake for 15 min and filter. Wash the filter with 0.05 M *sulphuric acid* until 25 ml of filtrate is obtained. To the filtrate add 1 ml of *concentrated ammonia R* and shake with 2 quantities, each of 10 ml, of *peroxide-free ether R*. If necessary, separate by centrifugation. Dry the combined ether layers over *anhydrous sodium sulphate R*, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *methanol R*.

Reference solution. Dissolve 50 mg of *hyoscyamine sulphate R* in 9 ml of *methanol R*. Dissolve 15 mg of *hyoscine hydrobromide R* in 10 ml of *methanol R*. Mix 3.8 ml of the hyoscyamine sulphate solution and 4.2 ml of the hyoscine hydrobromide solution and dilute to 10 ml with *methanol R*.

Apply separately to the plate as bands 20 mm by 3 mm 10 µl and 20 µl of each solution, leaving 1 cm between the bands. Develop over a path of 10 cm using a mixture of 3 volumes of *concentrated ammonia R*, 7 volumes of *water R* and 90 volumes of *acetone R*. Dry the plate

at 100-105 °C for 15 min, allow to cool and spray with *potassium iodobismuthate solution R2*, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background. The zones in the chromatograms obtained with the test solution are similar to those in the chromatograms obtained with the reference solution with respect to their position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and their colour. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution. Spray the plate with *sodium nitrite solution R* until the coating is transparent. Examine after 15 min. The zones corresponding to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Foreign matter (2.8.2). Not more than 3 per cent of stem having a diameter exceeding 5 mm.

Total ash (2.4.16). Not more than 20.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 4.0 per cent.

ASSAY

Take about 50 g of the drug and completely reduce it to a powder (180). Using the powder, determine the loss on drying and the total alkaloids.

a) Determine the loss on drying (2.2.32) on 2.000 g by drying in an oven at 100 °C to 105 °C.

b) Moisten 10.0 g of the powder with a mixture of 5 ml of *ammonia R*, 10 ml of *alcohol R* and 30 ml of *peroxide-free ether R* and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of *chloroform R* and 3 volumes of *peroxide-free ether R* until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator, dissolve the residue in 0.25 M *sulphuric acid* and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than 3 quantities, each of 20 ml, of 0.25 M *sulphuric acid*, separate the 2 layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. Make the acid layer alkaline with *ammonia R* and shake with 3 quantities, each of 30 ml, of *chloroform R*. Combine the chloroform layers, add 4 g of *anhydrous sodium sulphate R* and allow to stand for 30 min with occasional shaking. Decant the chloroform and wash the sodium sulphate with 3 quantities, each of 10 ml, of *chloroform R*. Add the washings to the chloroform extract, evaporate to dryness on a water-bath and heat in an oven at 100-105 °C for 15 min. Dissolve the residue in a few millilitres of *chloroform R*, add 20.0 ml of 0.01 M *sulphuric acid* and remove the chloroform by evaporation on a water-bath. Titrate the excess of acid with 0.02 M *sodium hydroxide* using *methyl red mixed solution R* as indicator.

Calculate the percentage content of total alkaloids, expressed as hyoscyamine, from the expression:

$$\frac{57.88 (20 - n)}{(100 - d) m}$$

- d = loss on drying as a percentage,
 n = volume of 0.02 M sodium hydroxide used in millilitres,
 m = mass of drug used, in grams.

STORAGE

Protected from moisture.

01/2005:0247

STRAMONIUM, PREPARED

Stramonii pulvis normatus

DEFINITION

Prepared stramonium is stramonium leaf powder (180) adjusted, if necessary, by the addition of powdered lactose or stramonium leaf of lower alkaloidal content to contain 0.23 per cent to 0.27 per cent of total alkaloids, calculated as hyoscyamine ($C_{17}H_{23}NO_3$; M_r 289.4) with reference to the dried drug.

CHARACTERS

Greyish-green powder with an unpleasant odour.

IDENTIFICATION

- Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of leaf lamina showing epidermal cells with slightly wavy anticlinal walls and smooth cuticle; stomata are more frequent on the lower epidermis (anisocytic and anomocytic) (2.8.3); covering trichomes are conical, uniseriate with three to five cells and warty walls; glandular trichomes are short and clavate with heads formed by 2 to 7 cells; dorsiventral mesophyll, with a single layer of palisade cells and a spongy parenchyma containing cluster crystals of calcium oxalate; annularly and spirally thickened vessels. The powdered drug may also show the following: fibres and reticulately thickened vessels from the stem; subspherical pollen grains usually about 60 µm to 80 µm in diameter with three germinal pores and nearly smooth exine; fragments of the corolla with papillose epidermis; seed fragments containing yellowish-brown, sinuous, thick-walled sclereids of testa; occasional prisms and microsphenoidal crystals of calcium oxalate. Examined in *glycerol (85 per cent) R*, it may be seen to contain lactose crystals.
- Examine the chromatograms obtained in the chromatography test. The principal zones in the chromatogram obtained with the test solution are similar in position, colour and size to the principal zones in the chromatogram obtained with the same volume of the reference solution.
- Shake 1 g with 10 ml of 0.05 M sulphuric acid for 2 min. Filter and add to the filtrate 1 ml of concentrated ammonia R and 5 ml of water R. Shake cautiously with 15 ml of peroxide-free ether R to avoid the formation of an emulsion. Separate the ether layer and dry over anhydrous sodium sulphate R. Filter and evaporate the ether in a porcelain dish. Add 0.5 ml of nitric acid R

and evaporate to dryness on a water-bath. Add 10 ml of acetone R and, dropwise, a 30 g/l solution of potassium hydroxide R in alcohol R. A deep violet colour develops.

TESTS

Chromatography. Examine by thin-layer chromatography (2.2.27), using silica gel G R as the coating substance.

Test solution. To 1.0 g add 10 ml of 0.05 M sulphuric acid, shake for 15 min and filter. Wash the filter with 0.05 M sulphuric acid until 25 ml of filtrate is obtained. To the filtrate add 1 ml of concentrated ammonia R and shake with two quantities, each of 10 ml, of peroxide-free ether R. If necessary, separate by centrifugation. Dry the combined ether layers over anhydrous sodium sulphate R, filter and evaporate to dryness on a water-bath. Dissolve the residue in 0.5 ml of methanol R.

Reference solution. Dissolve 50 mg of hyoscyamine sulphate R in 9 ml of methanol R. Dissolve 15 mg of hyoscine hydrobromide R in 10 ml of methanol R. Mix 3.8 ml of the hyoscyamine sulphate solution and 4.2 ml of the hyoscine hydrobromide solution and dilute to 10 ml with methanol R.

Apply separately to the plate as bands 20 mm by 3 mm 10 µl and 20 µl of each solution, leaving 1 cm between the bands. Develop over a path of 10 cm using a mixture of 3 volumes of concentrated ammonia R, 7 volumes of water R and 90 volumes of acetone R. Dry the plate at 100 °C to 105 °C for 15 min, allow to cool and spray with potassium iodobismuthate solution R2, using about 10 ml for a plate 200 mm square, until the orange or brown zones become visible against a yellow background. The zones in the chromatograms obtained with the test solution are similar to those in the chromatograms obtained with the reference solution with respect to their position (hyoscyamine in the lower third, hyoscine in the upper third of the chromatogram) and their colour. The zones in the chromatograms obtained with the test solution are at least equal in size to the corresponding zones in the chromatogram obtained with the same volume of the reference solution. Faint secondary zones may appear, particularly in the middle of the chromatogram obtained with 20 µl of the test solution or near the starting point in the chromatogram obtained with 10 µl of the test solution. Spray the plate with sodium nitrite solution R until the coating is transparent. Examine after 15 min. The zones corresponding to hyoscyamine in the chromatograms obtained with the test solution and the reference solution change from brown to reddish-brown but not to greyish-blue (atropine) and any secondary zones disappear.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Total ash (2.4.16). Not more than 20.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 4.0 per cent.

ASSAY

- Determine the loss on drying (2.2.32) on 2.000 g by drying in an oven at 100 °C to 105 °C.
- Moisten 10.0 g with a mixture of 5 ml of ammonia R, 10 ml of alcohol R and 30 ml of peroxide-free ether R and mix thoroughly. Transfer the mixture to a suitable percolator, if necessary with the aid of the extracting mixture. Allow to macerate for 4 h and percolate with a mixture of 1 volume of chloroform R and 3 volumes of peroxide-free ether R until the alkaloids are completely extracted. Evaporate to dryness a few millilitres of the liquid flowing from the percolator,

dissolve the residue in 0.25 M sulphuric acid and verify the absence of alkaloids using *potassium tetraiodomercurate solution R*. Concentrate the percolate to about 50 ml by distilling on a water-bath and transfer it to a separating funnel, rinsing with *peroxide-free ether R*. Add a quantity of *peroxide-free ether R* equal to at least 2.1 times the volume of the percolate to produce a liquid of a density well below that of water. Shake the solution with no fewer than three quantities, each of 20 ml, of 0.25 M sulphuric acid, separate the two layers by centrifugation if necessary and transfer the acid layers to a second separating funnel. m = mass of drug used in grams.

STORAGE

Store in an airtight container, protected from light.

01/2005:0356

STREPTOKINASE BULK SOLUTION

Streptokinasi solutio ad praeparationem

DEFINITION

Streptokinase bulk solution is a preparation of a protein obtained from culture filtrates of certain strains of haemolytic *Streptococcus* group C; it has the property of combining with human plasminogen to form plasminogen activator. It may contain buffer salts and other auxiliary substances. The potency is not less than 96 000 IU per milligram of protein.

PRODUCTION

If intended for use in the manufacture of parenteral dosage forms, the method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test.

Abnormal toxicity (2.6.9). Inject into each mouse a quantity of the preparation to be examined (if necessary, dilute with *water for injections R*) equivalent to 50 000 IU of streptokinase activity in 0.5 ml, the injection lasting 15-20 s.

CHARACTERS

Appearance: clear, colourless liquid.

IDENTIFICATION

- Place 0.5 ml of citrated human plasma in a haemolysis tube maintained in a water-bath at 37 °C. Add 0.1 ml of a dilution of the preparation to be examined containing 10 000 IU of streptokinase activity per millilitre in *phosphate buffer solution pH 7.2 R* and 0.1 ml of a solution of *human thrombin R* containing 20 IU/ml in *phosphate buffer solution pH 7.2 R*. Mix immediately. A clot forms and lyses within 30 min. Repeat the procedure using citrated bovine plasma. The clot does not lyse within 60 min.
- Dissolve 0.6 g of agar in 50.0 ml of *barbital buffer solution pH 8.6 RI*, heating until a clear solution is obtained. Use glass plates 50 mm square (transparency mounts) free from traces of grease. Using a pipette, apply to each plate 4 ml of the agar solution. Maintain the plates horizontal. Allow to cool. Pierce a cavity 6 mm in diameter in the centre of the agar and an appropriate number of cavities (not exceeding 6) at distances of 11 mm from the central cavity. Remove the residual agar from the cavities using a cannula connected to a vacuum pump. Using pipettes graduated in microlitres, place in the central cavity about 80 µl of goat or rabbit antistreptokinase serum containing 10 000 units of antistreptokinase activity per millilitre; place in each of the surrounding cavities about 80 µl of a dilution of the preparation to be examined containing 125 000 IU of streptokinase activity per millilitre. Allow the plates to stand in a humidified tank for 24 h. Only one precipitation arc appears and it is well defined and localised between the application point of the serum and each cavity containing the solution of the preparation to be examined.

TESTS

pH (2.2.3): 6.8 to 7.5.

Dilute the preparation to be examined in *carbon dioxide-free water R* to obtain a solution containing 5000 IU of streptokinase activity per millilitre.

Streptodornase: maximum 10 IU of streptodornase activity per 100 000 IU of streptokinase activity.

Test solution. Dilute the preparation to be examined in *imidazole buffer solution pH 6.5 R* to obtain a solution containing 150 000 IU of streptokinase activity per millilitre.

Reference solution. Dissolve in *imidazole buffer solution pH 6.5 R* a reference preparation of streptodornase, calibrated in International Units against the International Standard of streptodornase, to obtain a solution containing 20 IU of streptodornase activity per millilitre. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

To each of 8 numbered centrifuge tubes, add 0.5 ml of a 1 g/l solution of *sodium deoxyribonucleate R* in *imidazole buffer solution pH 6.5 R*. To tube number 1 and tube number 2 add 0.25 ml of *imidazole buffer solution pH 6.5 R*, 0.25 ml of the test solution and, immediately, 3.0 ml of perchloric acid (25 g/l HClO₄). Mix, centrifuge at about 3000 *g* for 5 min and measure the absorbances (2.2.25) of the supernatant liquids at 260 nm, using as the compensation liquid a mixture of 1.0 ml of *imidazole buffer solution pH 6.5 R* and 3.0 ml of perchloric acid (25 g/l HClO₄) (absorbances A₁ and A₂). To the other 6 tubes (numbers 3 to 8) add 0.25 ml, 0.25 ml, 0.125 ml, 0.125 ml, 0 ml and 0 ml respectively of *imidazole buffer solution pH 6.5 R*; add to each tube 0.25 ml of the test solution and 0 ml, 0 ml, 0.125 ml, 0.125 ml, 0.25 ml and 0.25 ml respectively of the reference solution. Mix the contents of each tube and heat at 37 °C for 15 min. To each tube add 3.0 ml of perchloric acid (25 g/l HClO₄), mix and centrifuge. Measure the absorbances (2.2.25) of the

supernatant liquids at 260 nm using the compensation liquid described above (absorbances A_3 to A_8). The absorbances comply with the following requirement:

$$(A_3 + A_4) - (A_1 + A_2) < \frac{(A_5 + A_6 + A_7 + A_8)}{2} - (A_3 + A_4)$$

Streptolysin. In a haemolysis tube, use a quantity of the preparation to be examined equivalent to 500 000 IU of streptokinase activity and dilute to 0.5 ml with a mixture of 1 volume of *phosphate buffer solution pH 7.2 R* and 9 volumes of a 9 g/l solution of *sodium chloride R*. Add 0.4 ml of a 23 g/l solution of *sodium thioglycollate R*. Heat in a water-bath at 37 °C for 10 min. Add 0.1 ml of a solution of a reference preparation of human antistreptolysin O containing 5 IU/ml. Heat at 37 °C for 5 min. Add 1 ml of *rabbit erythrocyte suspension R*. Heat at 37 °C for 30 min. Centrifuge at about 1000 g. In the same manner, prepare a haemolysis tube in which the solution of the preparation to be examined has been replaced by 0.5 ml of a mixture of 1 volume of *phosphate buffer solution pH 7.2 R* and 9 volumes of a 9 g/l solution of *sodium chloride R*. Measure the absorbances (2.2.25) of the supernatant liquids at 550 nm. The absorbance of the test solution is not more than 50 per cent greater than that of the reference solution.

Bacterial endotoxins (2.6.14): less than 0.02 IU per 100 IU of streptokinase activity, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Protein. (2.5.33, *Method 7, Procedure A*). 1 mg of N is equivalent to 6.25 mg of protein.

Potency

The potency of streptokinase is determined by comparing its capacity to activate plasminogen to form plasmin with the same capacity of a reference preparation of streptokinase calibrated in International Units; the formation of plasmin is determined using a suitable chromogenic substrate.

The International Unit is the activity of a stated amount of the International Standard for streptokinase. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Reference and test solutions

Prepare 2 independent series of 4 dilutions of each of the substance to be examined and of the reference preparation of streptokinase in *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R1*, in the range of 0.5–4.0 IU/ml. Prepare and maintain all solutions at 37 °C.

Substrate solution

Mix 1.0 ml of *tris(hydroxymethyl)aminomethane buffer solution pH 7.4 R* with 1.0 ml of *chromophore substrate R3*. Add 5 µl of a 100 g/l solution of *polysorbate 20 R*. Keep at 37 °C in a water-bath. Immediately before commencing the activation assay, add 45 µl of a 1 mg/ml solution of *human plasminogen R*.

Method

Analyse each streptokinase dilution, maintained at 37 °C, in duplicate. Initiate the activation reaction by adding 60 µl of each dilution to 40 µl of substrate solution. For blank wells, use 60 µl of *tris(hydroxymethyl)aminomethane sodium chloride buffer solution pH 7.4 R1* instead of the reference and test solutions. Allow the reaction to proceed at 37 °C for 20 min and read the absorbance (2.2.25) at 405 nm. If a suitable thermostatted plate reader is available, this may be used to monitor the reaction. Alternatively, it may be necessary to stop the reaction after 20 min using

50 µl of a 50 per cent *V/V* solution of *glacial acetic acid R*. Best results are obtained when the absorbance for the highest streptokinase concentration is between 0.1 and 0.2 (after blank subtraction). If necessary, adjust the time of incubation in order to reach this range of absorbances.

Calculate the regression of the absorbance on log concentrations of the solutions of the substance to be examined and of the reference preparation of streptokinase and calculate the potency of the substance to be examined using the usual statistical methods for parallel-line assays.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits ($P = 0.95$) of the estimated potency are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

In a sealed container, protected from light and at a temperature of –20 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the number of International Units of streptokinase activity per milligram, calculated with reference to the dried preparation,
- the name and quantity of any added substance,
- where applicable, that the substance is free from bacterial endotoxins,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

01/2005:0053

STREPTOMYCIN SULPHATE

Streptomycini sulfas

$C_{42}H_{84}N_{14}O_{36}S_3$

M_r 1457

DEFINITION

Streptomycin sulphate is bis[*N,N'*-bis(aminoiminomethyl)-4-*O*-[5-deoxy-2-*O*-[2-deoxy-2-(methylamino)-α-*L*-glucopyranosyl]-3-*C*-formyl-α-*L*-lyxofuranosyl]-D-streptamine] trisulphate, a substance produced by the growth of certain strains of *Streptomyces griseus* or obtained by any other means. Stabilisers may be added. The potency is not less than 720 IU/mg, calculated with reference to the dried substance.

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure. The method of manufacture is validated to demonstrate that the product if tested would comply with the following test:

Abnormal toxicity (2.6.9). Inject into each mouse 1 mg of the substance to be examined dissolved in 0.5 ml of *water for injections R*.

CHARACTERS

A white or almost white powder, hygroscopic, very soluble in water, practically insoluble in ethanol.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a plate coated with a 0.75 mm layer of the following mixture: mix 0.3 g of *carbomer R* with 240 ml of *water R* and allow to stand, with moderate shaking, for 1 h; adjust to pH 7 by the gradual addition, with continuous shaking, of *dilute sodium hydroxide solution R* and add 30 g of *silica gel H R*.

Heat the plate at 110 °C for 1 h, allow to cool and use immediately.

Test solution. Dissolve 10 mg of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *streptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *kanamycin monosulphate CRS*, 10 mg of *neomycin sulphate CRS* and 10 mg of *streptomycin sulphate CRS* in *water R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a 70 g/l solution of *potassium dihydrogen phosphate R*. Dry the plate in a current of warm air, and spray with a mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and a 460 g/l solution of *sulphuric acid R*. Heat at 150 °C for 5 min to 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

- B. Dissolve 5 mg to 10 mg in 4 ml of *water R* and add 1 ml of *1 M sodium hydroxide*. Heat in a water-bath for 4 min. Add a slight excess of *dilute hydrochloric acid R* and 0.1 ml of *ferric chloride solution R1*. A violet colour develops.
- C. Dissolve 0.1 g in 2 ml of *water R*, add 1 ml of α -*naphthol solution R* and 2 ml of a mixture of equal volumes of *strong sodium hypochlorite solution R* and *water R*. A red colour develops.
- D. Dissolve about 10 mg in 5 ml of *water R* and add 1 ml of *1 M hydrochloric acid*. Heat in a water-bath for 2 min. Add 2 ml of a 5 g/l solution of α -*naphthol R* in *1 M sodium hydroxide* and heat in a water-bath for 1 min. A faint yellow colour develops.
- E. It gives the reactions of sulphates (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is not more intensely coloured than intensity 3 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*). Allow to stand protected from light, at a temperature of about 20 °C for 24 h. Solution S is not more opalescent than reference suspension II (2.2.1).

pH (2.2.3). The pH of solution S is 4.5 to 7.0.

Methanol. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 1.00 g of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution. Dilute 12.0 mg of *methanol R* to 100 ml with *water R*.

The chromatographic procedure may be carried out using:

- a column 1.5 m to 2.0 m long and 2 mm to 4 mm in internal diameter, packed with *ethylvinylbenzene-divinylbenzene copolymer R* (150 µm to 180 µm),
- *nitrogen for chromatography R* as the carrier gas at a constant flow rate of 30 ml to 40 ml per minute,
- a flame-ionisation detector.

Maintain the column at a constant temperature between 120 °C and 140 °C and the injection port and the detector at a temperature at least 50 °C higher than that of the column. Inject the test solution and the reference solution. The area of the peak corresponding to methanol in the chromatogram obtained with the test solution is not greater than the area of the peak in the chromatogram obtained with the reference solution (0.3 per cent).

Streptomycin B. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in a freshly prepared mixture of 3 volumes of *sulphuric acid R* and 97 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Heat under a reflux condenser for 1 h, cool, rinse the condenser with *methanol R* and dilute to 20 ml with the same solvent (10 g/l solution).

Reference solution. Dissolve 36 mg of *mannose R* in a freshly prepared mixture of 3 volumes of *sulphuric acid R* and 97 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Heat under a reflux condenser for 1 h, cool, rinse the condenser with *methanol R* and dilute to 50 ml with the same solvent. Dilute 5 ml of the solution to 50 ml with *methanol R* (0.3 g/l solution expressed as streptomycin B; 1 mg of *mannose R* is equivalent to 4.13 mg of streptomycin B).

Apply separately to the plate 10 µl of each solution. Develop over a path of 13 cm to 15 cm using a mixture of 25 volumes of *glacial acetic acid R*, 25 volumes of *methanol R* and 50 volumes of *toluene R*. Allow the plate to dry in air and spray with a freshly prepared mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and a 20 per cent V/V solution of *sulphuric acid R* and heat at 110 °C for 5 min. Any spot corresponding to streptomycin B in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (3.0 per cent).

Loss on drying (2.2.32). Not more than 7.0 per cent, determined on 1.000 g by drying at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 24 h.

Sulphated ash (2.4.14). Not more than 1.0 per cent, determined on 1.000 g.

Sulphate. 18.0 per cent to 21.5 per cent of sulphate (SO₄), calculated with reference to the dried substance. Dissolve 0.250 g in 100 ml of *water R* and adjust the solution to

pH 11 using *concentrated ammonia R*. Add 10.0 ml of 0.1 M *barium chloride* and about 0.5 mg of *phthalein purple R*. Titrate with 0.1 M *sodium edetate* adding 50 ml of *alcohol R* when the colour of the solution begins to change and continue the titration until the violet-blue colour disappears. 1 ml of 0.1 M *barium chloride* is equivalent to 9.606 mg of sulphate (SO_4).

Colorimetric test. Dry the substance to be examined and *streptomycin sulphate CRS* at 60 °C over *diphosphorus pentoxide R* at a pressure not exceeding 0.1 kPa for 24 h. Dissolve 0.100 g of the dried substance to be examined in *water R* and dilute to 100.0 ml with the same solvent. Prepare a reference solution in the same manner using 0.100 g of the dried *streptomycin sulphate CRS*. Place 5.0 ml of each solution separately in two volumetric flasks and in a third flask place 5 ml of *water R*. To each flask add 5.0 ml of 0.2 M *sodium hydroxide* and heat for exactly 10 min in a water-bath. Cool in ice for exactly 5 min, add 3 ml of a 15 g/l solution of *ferric ammonium sulphate R* in 0.5 M *sulphuric acid*, dilute to 25.0 ml with *water R* and mix. Exactly 20 min after the addition of the ferric ammonium sulphate solution measure the absorbance (2.2.25) of the test solution and the reference solution in a 2 cm cell at the maximum at 525 nm, using as compensation liquid the solution prepared from 5 ml of *water R*. The absorbance of the test solution is not less than 90.0 per cent of that of the reference solution.

Bacterial endotoxins (2.6.14): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2).

STORAGE

Store in an airtight container. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- where applicable, the name and quantity of any added stabiliser,
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0357

SUCCINYLSULFATHIAZOLE

Succinylsulfathiazolum

$\text{C}_{13}\text{H}_{13}\text{N}_3\text{O}_5\text{S}_2 \cdot \text{H}_2\text{O}$

M_r 373.4

DEFINITION

Succinylsulfathiazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-oxo-4-[[4-(thiazol-2-ylsulphamoyl)phenyl]amino]butanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white, crystalline powder, very slightly soluble in water, slightly soluble in acetone and in alcohol. It dissolves in solutions of alkali hydroxides and carbonates.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *succinylsulfathiazole CRS*. If the spectra obtained in the solid state with the substance to be examined and the reference substance show differences, dissolve in hot *water R*, allow to crystallise, dry the crystals carefully between two sheets of filter paper and prepare new discs.
- To 2 g add 10 ml of *water R* and 10 ml of *strong sodium hydroxide solution R* and boil for 10 min. Cool and adjust to pH 3.0 with *hydrochloric acid R1*. Cool, adjust to pH 7.0 with *sodium hydrogen carbonate solution R* and filter. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 196 °C to 204 °C. Introduce the capillary containing the precipitate into the bath at a temperature of 190 °C.
- Heat 0.1 g in a test-tube over a small flame. Fumes are evolved which blacken *lead acetate paper R*.
- Place 0.1 g in a borosilicate-glass tube of about 30 ml capacity and add 0.5 g of *hydroquinone R* and 1 ml of *sulphuric acid R*. Heat in a glycerin bath at 135 °C for 10 min, mixing at the beginning of heating to obtain a homogeneous liquid phase. Allow to cool and place in iced water. Add carefully and with shaking 15 ml of *water R*. Add 5 ml of *toluene R*, shake for 5 s to 10 s and allow to stand for 2 min; promote separation of the two layers using a stirrer. The upper (toluene) layer shows an intense pink colour.
- Dissolve about 10 mg of the precipitate obtained in identification test B in 200 ml of 0.1 M *hydrochloric acid*. 2 ml of the solution gives the reaction of primary aromatic amines (2.3.1) with formation of an orange precipitate.

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 15 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_4 or BY_4 (2.2.2, *Method II*).

Acidity. To 2.0 g add 20 ml of *water R*, shake continuously for 30 min and filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. Not more than 2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Sulfathiazole and other primary aromatic amines. Dissolve 20 mg in a mixture of 3.5 ml of *water R*, 6 ml of *dilute hydrochloric acid R* and 25 ml of *alcohol R*, previously cooled to 15 °C. Place immediately in iced water and add 1 ml of a 2.5 g/l solution of *sodium nitrite R*. Allow to stand for 3 min, add 2.5 ml of a 40 g/l solution of *sulphamic acid R* and allow to stand for 5 min. Add 1 ml of a 4 g/l solution of *naphthylethylenediamine dihydrochloride R* and dilute to 50 ml with *water R*. Measured at 550 nm, the absorbance (2.2.25) is not greater than that of a standard prepared at the same time and in the same manner using a mixture of 1.5 ml of a solution containing 10 mg of *sulfathiazole R* and 0.5 ml of *hydrochloric acid R* per 100 ml; 2 ml of *water R*; 6 ml of *dilute hydrochloric acid R*; and 25 ml of *alcohol R*.

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): 4.0 per cent to 5.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 100 ml of a mixture of 1 volume of *hydrochloric acid R* and 2 volumes of *water R*. Heat under a reflux condenser for 1 h. Carry out the determination of primary aromatic amino-nitrogen (2.5.8), determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 35.54 mg of $C_{12}H_{22}O_{11}$.

STORAGE

Store protected from light.

01/2005:0204
corrected

SUCROSE

Saccharum

$C_{12}H_{22}O_{11}$

M_r 342.3

DEFINITION

β -D-Fructofuranosyl α -D-glucopyranoside.

It contains no additives.

CHARACTERS

Appearance: white or almost white, crystalline powder, or shiny, colourless or white or almost white crystals.

Solubility: very soluble in water, slightly soluble in alcohol, practically insoluble in ethanol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: *sucrose CRS*.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg each of *fructose CRS*, *glucose CRS*, *lactose CRS* and *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Plate: TLC silica gel G plate R.

Mobile phase: cold saturated boric acid solution R, 60 per cent V/V solution of *glacial acetic acid R*, *ethanol R*, *acetone R*, *ethyl acetate R* (10:15:20:60:60 V/V/V/V/V).

Application: 2 μ l.

Development: in an unsaturated tank over a path of 15 cm.

Drying: in a current of warm air.

Detection: spray with a solution of 0.5 g of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat the plate at 130 °C for 10 min.

System suitability: the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

C. Dilute 1 ml of solution S (see Tests) to 100 ml with *water R*. To 5 ml of the solution add 0.15 ml of freshly prepared *copper sulphate solution R* and 2 ml of freshly prepared *dilute sodium hydroxide solution R*. The solution is blue and clear and remains so after boiling. To the hot solution add 4 ml of *dilute hydrochloric acid R* and boil for 1 min. Add 4 ml of *dilute sodium hydroxide solution R*. An orange precipitate is formed immediately.

TESTS

Solution S. Dissolve 50.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1).

Conductivity (2.2.38): maximum 35 μ S $\cdot$ cm $^{-1}$.

Dissolve 31.3 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent. Measure the conductivity of the solution (C_1), while gently stirring with a magnetic stirrer, and that of the water used for preparing the solution (C_2). The readings must be stable within 1 per cent over a period of 30 s. Calculate the conductivity of the solution of the substance to be examined from the following expression:

$$C_1 - 0.35 C_2$$

Specific optical rotation (2.2.7): + 66.3 to + 67.0.

Dissolve 26.0 g in *water R* and dilute to 100.0 ml with the same solvent.

Colour value: maximum 45.

Dissolve 50.0 g in 50.0 ml of *water R*. Mix, filter (diameter of pores 0.45 μ m) and degas. Measure the absorbance (2.2.25) at 420 nm, using a cell of at least 4 cm (a cell length of 10 cm or more is preferred).

Calculate the colour value using the following expression:

$$\frac{A \times 1000}{b \times c}$$

- A* = absorbance measured at 420 nm,
b = path length in centimetres,
c = concentration of the solution, in grams per millilitre, calculated from the refractive index (2.2.6) of the solution; use Table 0204.-1 and interpolate the values if necessary.

Table 0204.-1

n_D^{20}	<i>c</i> (g/ml)
1.4138	0.570
1.4159	0.585
1.4179	0.600
1.4200	0.615
1.4221	0.630
1.4243	0.645
1.4264	0.661

System suitability:

- **repeatability:** the absolute difference between 2 results is maximum 3.

Dextrins. If intended for use in the preparation of large-volume infusions, it complies with the test for dextrins. To 2 ml of solution S add 8 ml of *water R*, 0.05 ml of *dilute hydrochloric acid R* and 0.05 ml of *0.05 M iodine*. The solution remains yellow.

Reducing sugars. To 5 ml of solution S in a test-tube about 150 mm long and 16 mm in diameter add 5 ml of *water R*, 1.0 ml of *1 M sodium hydroxide* and 1.0 ml of a 1 g/l solution of *methylene blue R*. Mix and place in a water-bath. After exactly 2 min, take the tube out of the bath and examine the solution immediately. The blue colour does not disappear completely. Ignore any blue colour at the air/solution interface.

Sulphites: maximum 10 ppm, calculated as SO₂.

Determine the sulphites content by a suitable enzymatic method based on the following reactions. Sulphite is oxidised by sulphite oxidase to sulphate and hydrogen peroxide which in turn is reduced by nicotinamide-adenine dinucleotide-peroxidase in the presence of reduced nicotinamide-adenine dinucleotide (NADH). The amount of NADH oxidised is proportional to the amount of sulphite.

Test solution. Dissolve 4.0 g of the substance to be examined in freshly prepared *distilled water R* and dilute to 10.0 ml with the same solvent.

Reference solution. Dissolve 4.0 g of the substance to be examined in freshly prepared *distilled water R*, add 0.5 ml of *sulphite standard solution (80 ppm SO₂) R* and dilute to 10.0 ml with freshly prepared *distilled water R*.

Blank solution. Freshly prepared *distilled water R*.

Separately introduce 2.0 ml each of the test solution, the reference solution and the blank in 10 mm cuvettes and add the reagents as described in the instructions in the kit for sulphite determination. Measure the absorbance (2.2.25) at the absorption maximum at about 340 nm before and at the end of the reaction time and subtract the value obtained with the blank.

The absorbance difference of the test solution is not greater than half the absorbance difference of the reference solution.

Lead: maximum 0.5 ppm.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 1.5 g of the substance to be examined in 1.5 ml of *deionised distilled water R* in a digestion tube⁽⁴⁾. Add 0.75 ml of *lead-free nitric acid R1* and slowly warm to 90-95 °C, avoiding spattering. Heat for about 60 min, add again 0.75 ml of *lead-free nitric acid R1*. Heat until all brown vapours have dissipated and any reddish tint is gone (about 60 min). Cool. Add 0.5 ml of *strong hydrogen peroxide solution R* dropwise and heat at 90-95 °C for 15 min. Cool. Add again 0.5 ml of *strong hydrogen peroxide solution R* dropwise, heat at 90-95 °C for 60 min and cool. Repeat these operations until a clear, light yellow solution is obtained. Dilute to 10.0 ml with *deionised distilled water R*. Store in capped plastic vials.

Reference solutions. Prepare 3 reference solutions in the same manner as the test solution but adding 0.5 ml, 1.0 ml and 1.5 ml respectively of *lead standard solution (0.5 ppm Pb) R* in addition to the 1.5 g of the substance to be examined.

Blank solution. Prepare a blank in the same manner as for the test solution but without the substance to be examined.

Zero-setting solution. *Deionised distilled water R*.

Apparatus. Suitable graphite furnace atomic absorption spectrometer equipped with a background compensation system, an autosampler and pyrolytically-coated tubes or with pyrolytic graphite platforms.

Source: hollow-cathode lamp or electrodeless discharge lamp.

Gas:

- *argon R* as the purge gas,
- air as alternate gas during the charring step.

Flow rate: to be adapted according to the apparatus; usually between 200 ml/min and 300 ml/min.

Wavelength: 283.3 nm.

Method. Separately inject 20 µl each of the zero-setting solution, the blank solution, the test solution, the reference solutions, and add immediately 5 µl of *magnesium nitrate solution R1*, which is used as matrix modifier, to each of the solutions. Inject each solution in triplicate.

The ashing and atomisation temperatures and times vary according to the apparatus, the background compensation system, and the graphite tube etc. The following parameters are given for guidance and have to be adjusted.

Heat the furnace progressively to 200 °C and maintain the drying temperature at 200 °C for 30 s, the ashing temperature at 750 °C for 40 s after a 40 s temperature rise, and the atomisation temperature at 1800 °C for 10 s (0 s temperature rise). Clean out at 2600 °C for 7 s after a 1 s temperature rise. Use the zero-setting solution to set the instrument zero. Calculate the mean readings of the test solution and of the reference solutions subtracting the mean blank. If necessary, dilute with the zero-setting solution to obtain a reading within the linear range.

System suitability:

- the relative standard deviation of the 3 readings obtained for the triplicate injections of the test solution and the reference solutions to which the mean blank has been subtracted is not greater than 15 per cent.

Loss on drying (2.2.32): maximum 0.1 per cent, determined on 2.000 g by drying in an oven at 100-105 °C for 3 h.

(4) An acid-cleaned high density polyethylene tube, a polypropylene tube, a teflon tube or a quartz tube is suitable.

Bacterial endotoxins (2.6.14): less than 0.25 IU/mg, if intended for use in the preparation of large-volume infusions.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of large-volume parenteral dosage forms.

01/2005:1569

SUFENTANIL

Sufentanilum

C₂₂H₃₀N₂O₂SM_r 386.6

DEFINITION

Sufentanil contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-[4-(methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylpropanamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in alcohol and in methanol.

It melts at about 98 °C.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of sufentanil*.

TESTS

Appearance of solution. Dissolve 0.10 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to prepare *in situ* the degradation compound (sufentanil impurity E), dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Add 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min:

Mobile phase A. A 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	90 → 40	10 → 60	linear gradient
15 - 20	40	60	isocratic
20 - 21	40 → 90	60 → 10	switch to initial eluent composition
21 - 25	90	10	re-equilibration

- as detector a spectrophotometer set at 220 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate with the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions, the retention times are: impurity E about 12 min and sufentanil about 13 min. The test is not valid unless the resolution between the peaks corresponding to sufentanil and impurity E is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Inject 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak due to the blank and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 2 h.

ASSAY

Dissolve 0.300 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 38.66 mg of C₂₂H₃₀N₂O₂S.

STORAGE

Store protected from light.

IMPURITIES

Specified impurities: D, F, H.

Other detectable impurities: A, B, C, E, G, I.

01/2005:1269

A. *N*-[4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide,

B. *cis*-4-(methoxymethyl)-4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl]piperidine 1-oxide,

C. $R = R' = H$: [4-(phenylamino)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]methanol,

D. $R = CO-CH_3$, $R' = CH_3$: *N*-[4-(methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylacetamide,

E. $R = H$, $R' = CH_3$: 4-(methoxymethyl)-*N*-phenyl-1-[2-(thiophen-2-yl)ethyl]piperidin-4-amine,

G. $R = R' = CO-CH_2-CH_3$: [4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]methyl propanoate,

H. $R = CO-CH_2-CH_2-CH_3$, $R' = CH_3$: *N*-[4-(methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylbutanamide,

F. *N*-[4-(methoxymethyl)-1-[2-(thiophen-3-yl)ethyl]piperidin-4-yl]-*N*-phenylpropanamide,

I. *trans*-4-(methoxymethyl)-4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl]piperidine 1-oxide.

SUFENTANIL CITRATE

Sufentanili citras

 $C_{28}H_{38}N_2O_9S$
 M_r 578.7

DEFINITION

Sufentanil citrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of *N*-[4-(methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylpropanamide citrate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, soluble in water and in alcohol, freely soluble in methanol.

It melts at about 140 °C, with decomposition.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of sufentanil citrate*.

TESTS

Appearance of solution. Dissolve 0.2 g of the substance to be examined in *water R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). In order to prepare *in situ* the degradation compound (sufentanil impurity E), dissolve 10 mg of the substance to be examined in 10.0 ml of *dilute hydrochloric acid R*. Heat on a water-bath under a reflux condenser for 4 h. Add 10.0 ml of *dilute sodium hydroxide solution R*. Evaporate to dryness on a water-bath. Cool and take up the residue in 10 ml of *methanol R*. Filter.

Reference solution (b). Dilute 5.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.5 ml/min the following mixtures:

Mobile phase A. A 5 g/l solution of *ammonium carbonate R* in a mixture of 10 volumes of *tetrahydrofuran R* and 90 volumes of *water R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	90 → 40	10 → 60	linear gradient
15 - 20	40	60	isocratic elution
20 - 25	90	10	switch to initial eluent composition
25 = 0	90	10	restart gradient

— as detector a spectrophotometer set at 220 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* and then equilibrate at the initial eluent composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: sufentanil impurity E about 12 min and sufentanil about 13 min. The test is not valid unless the resolution between the peaks corresponding to sufentanil and sufentanil impurity E is at least 4.0. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all of the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak obtained with the blank run, any peak with a retention time relative to the main compound of 0.05 or less, and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C.

ASSAY

Dissolve 0.400 g in 50 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R* and titrate with 0.1 M *perchloric acid*, using 0.2 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 57.87 mg of C₂₈H₃₈N₂O₉S.

STORAGE

Store protected from light.

IMPURITIES

A. *N*-[4-(methoxymethyl)piperidin-4-yl]-*N*-phenylpropanamide,

B. *cis*-4-(methoxymethyl)-4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl]piperidine 1-oxide,

C. R = R' = H: [4-(phenylamino)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]methanol,

D. R = CO-CH₃, R' = CH₃: *N*-[4-(methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylacetamide,

E. R = H, R' = CH₃: 4-(methoxymethyl)-*N*-phenyl-1-[2-(thiophen-2-yl)ethyl] piperidin-4-amine,

G. R = R' = CO-CH₂-CH₃: [4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl] piperidin-4-yl]methyl propanoate,

H. R = CO-CH₂-CH₂-CH₃, R' = CH₃: *N*-[4-(methoxymethyl)-1-[2-(thiophen-2-yl)ethyl]piperidin-4-yl]-*N*-phenylbutanamide,

F. *N*-[4-(methoxymethyl)-1-[2-(thiophen-3-yl)ethyl]piperidin-4-yl]-*N*-phenylpropanamide,

I. *trans*-4-(methoxymethyl)-4-(phenylpropanoylamino)-1-[2-(thiophen-2-yl)ethyl]piperidine 1-oxide.

01/2005:1570

SUGAR SPHERES

Sacchari spheri

DEFINITION

Sugar spheres contain not more than 92 per cent of sucrose, calculated on the dried basis. The remainder consists of maize starch and may also contain starch hydrolysates and colour additives. The diameter of sugar spheres varies usually from 200 µm to 2000 µm and the upper and lower limits of the size of the sugar spheres are stated on the label.

IDENTIFICATION

- A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Mix 2 ml of solution S (see Tests) with 3 ml of *methanol R*. Dilute to 20 ml with a mixture of 2 volumes of *water R* and 3 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *fructose CRS*, 10 mg of *glucose CRS*, 10 mg of *lactose CRS* and 10 mg of *sucrose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply to the plate 2 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*, measured accurately as a slight excess of water causes cloudiness of the solution. Dry the plate in a current of warm air. Repeat the development immediately after renewing the mobile phase. Dry the plate in a current of warm air and spray evenly with a 5 g/l solution of *thymol R* in a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *alcohol R*. Heat at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 4 clearly separated spots.

- B. To water slurry of the insoluble portion obtained (see Assay), add 0.05 ml of *iodine solution R1*. A dark-blue is produced which disappears on heating.
- C. To 5 ml of solution S add 0.15 ml of freshly prepared *copper sulphate solution R* and 2 ml of freshly prepared *dilute sodium hydroxide solution R*. The solution is blue and clear and remains so after boiling. To the hot solution add 4 ml of *dilute hydrochloric acid R* and boil for 1 min. Add 4 ml of *dilute sodium hydroxide solution R*. An orange precipitate is formed immediately.

TESTS

Solution S. To 0.5 g in a 100 ml volumetric flask add 80 ml of *water R* and shake until the sucrose is dissolved. Dilute to 100.0 ml with *water R*. Filter under vacuum to obtain a clear solution.

Fineness (2.9.12). Minimum of 90 per cent (*m/m*) of the sugar spheres are between the lower and the upper limits of the size of the sugar spheres stated on the label.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (5 ppm). Prepare the standard using 1.0 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 2 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10³ bacteria and 10² fungi per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

Sucrose content

Weigh 10.000 g of ground sugar spheres in a 100 ml graduated flask and complete to 100.0 ml with *water R*. Stir and decant. Filter under vacuum to obtain a clear solution (the insoluble portion is used for the identification test B). Measure the angle of optical rotation (2.2.7) and calculate the sucrose percentage content as follows:

$$\frac{10^6 \times \alpha}{66.5 \times l \times m \times (100 - H)}$$

α = angle of rotation,

l = length of the polarimeter tube, in decimetres,

m = exact weight of the granules sample, in grams,

H = loss on drying.

LABELLING

The label states:

- the upper and the lower limits of the size of the sugar spheres,
- any added colour additives,
- any added starch hydrolysates.

01/2005:0107

SULFACETAMIDE SODIUM

Sulfacetamidum natricum

C₈H₉N₂NaO₃S·H₂O*M*_r 254.2

DEFINITION

Sulfacetamide sodium contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of the sodium derivative of *N*-(4-aminophenyl)sulfonylacetamide, calculated with reference to the anhydrous substance.

CHARACTERS

A white or yellowish-white, crystalline powder, freely soluble in water, slightly soluble in ethanol.

IDENTIFICATION

First identification: B, F.

Second identification: A, C, D, E, F.

- A. Dissolve 0.1 g in *phosphate buffer solution pH 7.0 R* and dilute to 100.0 ml with the same buffer solution. Dilute 1.0 ml of the solution to 100.0 ml with *phosphate buffer solution pH 7.0 R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 255 nm. The specific absorbance at the maximum is 660 to 720, calculated with reference to the anhydrous substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfacetamide sodium CRS*.
- C. Dissolve 1 g in 10 ml of *water R*, add 6 ml of *dilute acetic acid R* and filter. The precipitate, washed with a small quantity of *water R* and dried at 100 °C to 105 °C for 4 h, melts (2.2.14) at 181 °C to 185 °C.

01/2005:0294

- D. Dissolve 0.1 g of the precipitate obtained in identification test C in 5 ml of *alcohol R*. Add 0.2 ml of *sulphuric acid R* and heat. The odour of ethyl acetate is perceptible.
- E. Dissolve about 1 mg of the precipitate obtained in identification test C, with heating, in 1 ml of *water R*. The solution gives the reaction of primary aromatic amines (2.3.1) with formation of an orange-red precipitate.
- F. Solution S (see Tests) gives the reactions of sodium (2.3.1).

TESTS

Solution S. Dissolve 1.25 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₄ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 8.0 to 9.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.5 g of the substance to be examined in *water R* and dilute to 15 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *sulfanilamide R* in *water R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *water R*.

Reference solution (c). Dissolve 5 mg of *sulfanilamide R* in 10 ml of the test solution.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 25 volumes of *ethanol R*, 25 volumes of *water R* and 50 volumes of *butanol R*. Allow the plate to dry in air and spray with *dimethylaminobenzaldehyde solution R2*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.5 per cent), and not more than one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Sulphates (2.4.13). Dissolve 2.5 g in *distilled water R* and dilute to 25 ml with the same solvent. Add 25 ml of *dilute acetic acid R*, shake for 30 min and filter. 15 ml of the filtrate complies with the limit test for sulphates (200 ppm).

Heavy metals (2.4.8). 12 ml of the filtrate obtained in the test for sulphates complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). 6.0 per cent to 8.0 per cent, determined on 0.200 g by the semi-micro determination of water.

ASSAY

Dissolve 0.500 g in a mixture of 50 ml of *water R* and 20 ml of *dilute hydrochloric acid R*. Cool the solution in iced water and carry out the determination of primary aromatic amino-nitrogen (2.5.8), determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 23.62 mg of C₈H₉N₃NaO₃S.

STORAGE

Store protected from light.

SULFADIAZINE

Sulfadiazinum

C₁₀H₁₀N₄O₂SM_r 250.3

DEFINITION

Sulfadiazine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-pyrimidin-2-ylbenzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White, yellowish-white or pinkish-white, crystalline powder or crystals, practically insoluble in water, slightly soluble in acetone, very slightly soluble in alcohol. It dissolves in solutions of alkali hydroxides and in dilute mineral acids. It melts at about 255 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfadiazine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) corresponds in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- Place 3 g in a dry tube. Immerse the lower part of the tube, inclined at 45°, in a silicone oil bath and heat to about 270 °C. The substance to be examined decomposes and a white or yellowish-white sublimate is formed which, after recrystallisation from *toluene R* and drying at 100 °C, melts (2.2.14) at 123 °C to 127 °C.
- Dissolve about 5 mg in 10 ml of 1 M *hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 0.8 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y₅, BY₅ or GY₅ (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at about 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in 0.5 ml of *concentrated ammonia R* and dilute to 5.0 ml with *methanol R*. If the solution is not clear, heat gently until dissolution is complete.

Reference solution (a). Dissolve 20 mg of *sulfadiazine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (a) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (b), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in a mixture of 20 ml of *dilute hydrochloric acid R* and 50 ml of *water R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (2.5.8), determining the end-point electrometrically. 1 ml of 0.1 M *sodium nitrite* is equivalent to 25.03 mg of C₁₂H₁₄N₄O₂S.

STORAGE

Store protected from light.

01/2005:0295

SULFADIMIDINE

Sulfadimidinum

C₁₂H₁₄N₄O₂S

M_r 278.3

DEFINITION

Sulfadimidine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(4,6-dimethylpyrimidin-2-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or almost white powder or crystals, very slightly soluble in water, soluble in acetone, slightly soluble in alcohol. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 197 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfadimidine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) corresponds in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- Place 3 g in a dry tube. Immerse the lower part of the tube, inclined at 45°, in a silicone oil bath and heat to about 270 °C. The substance to be examined decomposes and a white or yellowish-white sublimate is formed which, after recrystallisation from *toluene R* and drying at 100 °C, melts (2.2.14) at 150 °C to 154 °C.
- Dissolve about 5 mg in 10 ml of 1 M *hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y₅, BY₅ or GY₅ (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at about 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in 0.5 ml of *concentrated ammonia R* and dilute to 5.0 ml with *methanol R*. If the solution is not clear, heat gently until dissolution is complete.

Reference solution (a). Dissolve 20 mg of *sulfadimidine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (a) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (b), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in a mixture of 20 ml of *dilute hydrochloric acid R* and 50 ml of *water R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (2.5.8), determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 27.83 mg of $C_{12}H_{14}N_4O_4S$.

STORAGE

Store protected from light.

01/2005:0740

SULFADOXINE

Sulfadoxinum

 $C_{12}H_{14}N_4O_4S$
 M_r 310.3

DEFINITION

Sulfadoxine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(5,6-dimethoxypyrimidin-4-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white crystalline powder or crystals, very slightly soluble in water, slightly soluble in alcohol and in methanol. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 198 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfadoxine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve 0.5 g in 1 ml of a 40 per cent *V/V* solution of *sulphuric acid R*, heating gently. Continue heating until a crystalline precipitate appears (about 2 min). Allow to cool and add 10 ml of *dilute sodium hydroxide solution R*. Cool again. Add 25 ml of *ether R* and shake for 5 min. Separate the ether layer, dry over *anhydrous*

sodium sulphate R and filter. Evaporate the solvent by heating in a water-bath. The residue melts (2.2.14) at 80 °C to 82 °C or at 90 °C to 92 °C.

- Dissolve about 5 mg in 10 ml of 1 M *hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y_5 , BY_5 or GY_5 (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in a bath of iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulfadoxine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 100 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (2.5.8), using 0.250 g and determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 31.03 mg of $C_{12}H_{14}N_4O_4S$.

STORAGE

Store protected from light.

01/2005:0741 **Related substances.** Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

SULFAFURAZOLE

Sulfafurazolum

$C_{11}H_{13}N_3O_3S$

M_r 267.3

DEFINITION

Sulfafurazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(3,4-dimethylisoxazol-5-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white, crystalline powder or crystals, practically insoluble in water, sparingly soluble in alcohol, slightly soluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 197 °C, with decomposition.

IDENTIFICATION

First identification: A, C.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfafurazole CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- To 0.5 g add 1 ml of a 40 per cent *V/V* solution of *sulphuric acid R* and heat over a low flame to dissolve. Continue heating until a crystalline precipitate appears (about 2 min). Allow to cool and add 10 ml of *dilute sodium hydroxide solution R*. Cool. Shake the solution for 5 min with 25 ml of *ether R*. Separate the ether layer, dry over *anhydrous sodium sulphate R* and filter. Evaporate the solvent by heating on a water-bath. The residue melts (2.2.14) at 119 °C to 123 °C.
- Dissolve about 5 mg in 10 ml of *1 M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 0.4 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*, with gently warming if necessary. The solution is not more intensely coloured than reference solution Y_6 , BY_6 or GY_6 (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of *0.1 M sodium hydroxide* is required to change the colour of the indicator.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulfafurazole CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (b) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 25 volumes of *methanol R* and 75 volumes of *methylene chloride R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *acetone R*. Titrate with *0.1 M tetrabutylammonium hydroxide* using a 4 g/l solution of *thymol blue R* in *methanol R* as indicator.

1 ml of *0.1 M tetrabutylammonium hydroxide* is equivalent to 26.73 mg of $C_{11}H_{13}N_3O_3S$.

STORAGE

Store protected from light.

01/2005:1476

SULFAGUANIDINE

Sulfaguanidinum

$C_7H_{10}N_4O_2S$

M_r 214.3

DEFINITION

Sulfaguanidine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (4-aminophenylsulphonyl)guanidine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, fine crystalline powder, very slightly soluble in water, slightly soluble in acetone, very slightly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

- A. Melting point (2.2.14): 189 °C to 193 °C, determined on the dried substance.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfaguandine CRS*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 5 mg in 10 ml of 1 M hydrochloric acid. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).
- E. Suspend 0.1 g in 2 ml of *water R*, add 1 ml of α -naphthol solution *R* and 2 ml of a mixture of equal volumes of *water R* and strong sodium hypochlorite solution *R*. A red colour develops.

TESTS

Solution S. To 2.5 g, add 40 ml of carbon dioxide-free *water R*. Heat at about 70 °C for 5 min. Cool while stirring in iced water for about 15 min, filter and dilute to 50 ml with carbon dioxide-free *water R*.

Acidity. To 20 ml of solution S, add 0.1 ml of bromothymol blue solution *R1*. Not more than 0.2 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Related substances. Examine by thin layer chromatography (2.2.27), using a TLC silica gel GF₂₅₄ plate *R*.

Test solution (a). Dissolve 50 mg of the substance to be examined in acetone *R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with acetone *R*.

Reference solution (a). Dissolve 10 mg of sulfaguandine *CRS* in acetone *R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 5 ml of test solution (b) to 200 ml with acetone *R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with acetone *R*.

Reference solution (d). Dissolve 10 mg of sulfanilamide *R* in test solution (b) and dilute to 5 ml with the same solution.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of anhydrous formic acid *R*, 20 volumes of methanol *R* and 70 volumes of methylene chloride *R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated principal spots.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test F for heavy metals (20 ppm). Prepare the standard using of lead standard solution (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 8.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.175 g in 50 ml of dilute hydrochloric acid *R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (2.5.8), determining the end-point electrometrically.

1 ml of 0.1 M sodium nitrite is equivalent to 21.42 mg of C₇H₁₀N₄O₂S.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H: 4-aminobenzenesulphonamide (sulphanilamide),
- B. R = CO-NH₂: N-[(4-aminophenyl)sulphonyl]urea (sulphacarbamide).

01/2005:0358

SULFAMERAZINE

Sulfamerazinum

C₁₁H₁₂N₄O₂SM_r 264.3

DEFINITION

Sulfamerazine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-N-(4-methyl-2-pyrimidinyl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White, yellowish-white or pinkish-white, crystalline powder or crystals, very slightly soluble in water, sparingly soluble in acetone, slightly soluble in alcohol, very slightly soluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 235 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfamerazine CRS*. Examine the substances as discs.

- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Place 3 g in a dry tube. Incline the tube by about 45°, immerse the bottom of the tube in a silicone-oil bath and heat to about 270 °C. The substance decomposes, producing a white or yellowish-white sublimate which, after recrystallisation from *toluene R* and drying at 100 °C, melts (2.2.14) at 157 °C to 161 °C.
- D. Dissolve about 20 mg in 0.5 ml of *dilute hydrochloric acid R* and add 1 ml of *water R*. The solution gives, without further addition of acid, the identification reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 0.8 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y₄, BY₄ or GY₄ (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 40 ml of *carbon dioxide-free water R* and heat at about 70 °C for 5 min. Cool for about 15 min in iced water and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27) using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (a). Dissolve 10 mg of *sulfamerazine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm with a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2500 g in a mixture of 20 ml of *dilute hydrochloric acid R* and 50 ml of *water R*. Cool the solution in iced water. Carry out the determination of primary aromatic amino-nitrogen (2.5.8), determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 26.43 mg of C₁₁H₁₂N₄O₂S.

STORAGE

Store protected from light.

01/2005:0637

SULFAMETHIZOLE

Sulfamethizolum

C₉H₁₀N₄O₂S₂M_r 270.3

DEFINITION

Sulfamethizole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(5-methyl-1,3,4-thiadiazol-2-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white crystalline powder or crystals, very slightly soluble in water, soluble in acetone, sparingly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides and in dilute mineral acids.

It melts at about 210 °C.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfamethizole CRS*. Examine the substances prepared as discs.
- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- C. Dissolve 50 mg in 4 ml of *methanol R* and add 0.2 ml of a 40 g/l solution of *copper acetate R*. A flocculent, yellowish-green precipitate is formed, changing to dark green.
- D. Dissolve about 5 mg in 1 M *hydrochloric acid* and dilute to 10 ml with the same solvent. Dilute 1 ml of this solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y₅, BY₅ or GY₅ (2.2.2, *Method II*).

Acidity. To 1.25 g add 25 ml of *carbon dioxide-free water R* and heat at 70 °C for 5 min. Cool for about 15 min in iced water and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.30 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 30 mg of *sulfamethizole CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 20 ml with *acetone R*.

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of *methanol R* and 80 volumes of *chloroform R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (2.5.8), using 0.2500 g and determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 27.03 mg of C₉H₁₀N₄O₂S₂.

STORAGE

Store protected from light.

01/2005:0108

SULFAMETHOXAZOLE

Sulfamethoxazolum

C₁₀H₁₁N₃O₃S

*M*_r 253.3

DEFINITION

4-Amino-*N*-(5-methylisoxazol-3-yl)benzenesulphonamide.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, sparingly soluble in ethanol (96 per cent). It dissolves in dilute solutions of sodium hydroxide and in dilute acids.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 169 °C to 172 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *sulfamethoxazole CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution. Dissolve 20 mg of *sulfamethoxazole CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Plate: *TLC silica gel F₂₅₄ plate R*.

Mobile phase: *dilute ammonia R1, water R, nitromethane R, dioxan R* (3:5:41:51 V/V/V/V).

Application: 5 µl.

Development: over 3/4 of the plate.

Drying: at 100-105 °C.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 5 mg in 10 ml of 1 M *hydrochloric acid*.

Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₅, BY₅ or GY₅ (2.2.2, *Method II*).

Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*.

Acidity. To 1.25 g, finely powdered, add 25 ml of *water R*. Heat at 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.3 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 45 ml of the mobile phase, sonicate at about 45 °C for 10 min, cool and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 1 mg of the substance to be examined and 1 mg of *sulfamethoxazole impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 1.0 mg of *sulfamethoxazole impurity F CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- **size:** *l* = 0.25 m, Ø = 4.0 mm,
- **stationary phase:** *octylsilyl silica gel for chromatography R* (5 µm),
- **temperature:** 30 °C.

Mobile phase: mix 35 volumes of *methanol R2* and 65 volumes of a 13.6 g/l solution of *potassium dihydrogen phosphate R*, then adjust to pH 6.0 with a 100 g/l solution of *potassium hydroxide R*.

Flow rate: 0.9 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of sulfamethoxazole.

Relative retentions with reference to sulfamethoxazole (retention time = about 10 min): impurity D = about 0.3; impurity E = about 0.35; impurity F = about 0.45; impurity C = about 0.5; impurity A = about 1.2; impurity B = about 2.0.

System suitability: reference solution (b):

- **resolution:** minimum 3.5 between the peaks due to sulfamethoxazole and impurity A.

Limits:

- **impurities A, B, C, D, E:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **impurity F:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the reference solution using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the assay of primary aromatic amino-nitrogen (2.5.8), using 0.200 g and determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 25.33 mg of $C_{10}H_{11}N_4O_3S$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

- A. R = CO-CH₃: N-[4-[(5-methylisoxazol-3-yl)sulphamoyl]phenyl]acetamide,
- B. R = SO₂-C₆H₄-p-NH₂: 4-[[[(4-aminophenyl)sulphonyl]amino]-N-(5-methylisoxazol-3-yl)benzenesulphonamide,

C. 5-methylisoxazol-3-amine,

D. R = OH: 4-aminobenzenesulphonic acid (sulphanilic acid),

E. R = NH₂: 4-aminobenzenesulphonamide (sulphanilamide),

F. 4-amino-N-(3-methylisoxazol-5-yl)benzenesulphonamide.

01/2005:0638

SULFAMETHOXPYRIDAZINE FOR VETERINARY USE

Sulfamethoxypyridazinum ad usum veterinarium

$C_{11}H_{12}N_4O_3S$

M_r 280.3

DEFINITION

Sulfamethoxypyridazine for veterinary use contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-N-(6-methoxypyridazin-3-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, colouring slowly on exposure to light, practically insoluble in water, sparingly soluble in acetone, slightly soluble in alcohol, very slightly soluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids. It melts at about 180 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfamethoxypyridazine CRS*. Examine the substances prepared as discs.
- B. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

01/2005:1571

SULFANILAMIDE

Sulfanilamidum

 $C_6H_8N_2O_2S$ M_r 172.2

DEFINITION

Sulfanilamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-aminobenzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white crystals or fine powder, slightly soluble in water, freely soluble in acetone, sparingly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in solutions of alkali hydroxides and in dilute mineral acids.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 164.5 °C to 166.0 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfanilamide CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 5 mg in 10 ml of 1 M hydrochloric acid. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Solution S. To 2.5 g add 50 ml of *carbon dioxide-free water R*. Heat at about 70 °C for about 5 min. Cool in iced water for about 15 min and filter.

Acidity. To 20 ml of solution S add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution (a). Dissolve 20 mg of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in 0.5 ml of *concentrated ammonia R* and dilute to 5 ml with *methanol R*. If the solution is not clear, heat gently until dissolution is complete.

Reference solution (a). Dissolve 20 mg of *sulfanilamide CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

C. Dissolve 0.5 g in 1 ml of a 40 per cent V/V solution of *sulphuric acid R*, heating gently. Continue heating until a crystalline precipitate appears (about 2 min). Cool and add 10 ml of *dilute sodium hydroxide solution R*. Cool again, add 25 ml of *ether R* and shake the solution for 5 min. Separate the ether layer, dry over *anhydrous sodium sulphate R* and filter. Evaporate the ether by heating in a water-bath. An oily residue is obtained which becomes crystalline on cooling; if necessary, scratch the wall of the container with a glass rod. The residue melts (2.2.14) at 102 °C to 106 °C.

D. Dissolve about 5 mg in 10 ml of 1 M hydrochloric acid. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 10 ml of 1 M sodium hydroxide and 15 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₄ or BY₄ (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.5 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator.

Related substances. Examine by thin layer chromatography (2.2.27), using *TLC silica gel GF₂₅₄ plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 20 mg of *sulfamethoxyypyridazine CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 2.5 ml of test solution (b) to 50 ml with *acetone R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *dilute ammonia R1*, 9 volumes of *water R*, 30 volumes of *2-propanol R* and 50 volumes of *ethyl acetate R*. Dry the plate at 100-105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the assay of primary aromatic amino-nitrogen (2.5.8), using 0.2500 g, determining the end-point electrometrically.

1 ml of 0.1 M sodium nitrite is equivalent to 28.03 mg of C₁₁H₁₂N₄O₃S.

STORAGE

Protected from light.

Reference solution (b). Dilute 1.25 ml of test solution (a) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Reference solution (c). Dissolve 20 mg of the substance to be examined and 20 mg of *sulfamerazine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Apply to the plate 5 µl of each solution. Develop over a path corresponding to two-thirds of the plate height using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (b), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (2.5.8), using 0.140 g and determining the end-point electrometrically.

1 ml of 0.1 M *sodium nitrite* is equivalent to 17.22 mg of C₁₈H₁₄N₄O₅S.

STORAGE

Store protected from light.

01/2005:0863

SULFASALAZINE

Sulfasalazinum

C₁₈H₁₄N₄O₅S

*M*_r 398.4

DEFINITION

Sulfasalazine contains not less than 97.0 per cent and not more than the equivalent of 101.5 per cent of 2-hydroxy-5-[2-[4-(pyridin-2-ylsulphamoyl)phenyl]diazenyl]benzoic acid, calculated with reference to the dried substance.

CHARACTERS

A bright yellow or brownish-yellow, fine powder, practically insoluble in water, very slightly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfasalazine CRS*. Examine the substances prepared as discs.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *dilute ammonia R3* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *dilute ammonia R3*.

Reference solution (b). Dissolve 1.0 mg of *sulfasalazine derivative for resolution CRS* in 10.0 ml of reference solution (a). Dilute 1.0 ml of this solution to 10.0 ml with reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min:

Mobile phase A. In a 1000 ml volumetric flask dissolve 1.13 g of *sodium dihydrogen phosphate R* and 2.5 g of *sodium acetate R* in 900 ml of *water R*. Adjust to pH 4.8 with *glacial acetic acid R* and adjust the volume to 1000 ml with *water R*,

Mobile phase B. Mix 1 volume of mobile phase A with 4 volumes of *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 15	60 → 45	40 → 55	linear gradient
15 - 25	45	55	isocratic
25 - 60	45 → 0	55 → 100	linear gradient
60 - 65	0	100	isocratic
65 - 67	0 → 60	100 → 40	switch to initial composition
67 - 77	60	40	re-equilibration

- as detector a spectrophotometer set at 320 nm.

Inject 20 µl of reference solution (a). Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (b). The test is not valid unless the resolution between the peaks corresponding to sulfasalazine and sulfasalazine derivative for resolution is at least 3.0.

Inject 20 µl of the test solution and 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the approximate retention times relative to sulfasalazine are the following: impurity A = 2.00; impurity B = 1.85; impurity C = 0.80; impurity D = 1.90; impurity E = 1.63; impurity F = 0.85; impurity G = 1.39; impurity H = 0.16; impurity I = 0.28.

In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); the sum of the areas of all peaks, apart from the principal peak is not greater than four times the area of the principal peak in the chromatogram obtained with reference solution (a) (4 per cent). Disregard any peak with a retention time shorter than 6 min (corresponding to salicylic acid and sulfapyridine) and

any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a).

Salicylic acid and sulfapyridine. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *dilute ammonia R3* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of *salicylic acid R* and 5.0 mg of *sulfapyridine CRS* in *dilute ammonia R3* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 2.0 ml of *reference solution (a)* to 100.0 ml with *dilute ammonia R3*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 70 volumes of mobile phase A (described in the test for related substances) and 30 volumes of mobile phase B (described in the test for related substances),
- as detector a spectrophotometer set at 300 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peaks in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. When the chromatogram is recorded in the prescribed conditions, the retention times are: salicylic acid about 6 min and sulfapyridine about 7 min. The test is not valid unless the resolution between the peaks corresponding to salicylic acid and sulfapyridine is at least 2.

Inject 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 10 min. In the chromatogram obtained with the test solution the area of the peak corresponding to salicylic acid is not greater than 0.5 times the area of the first peak in the chromatogram obtained with reference solution (b) (0.5 per cent) and the peak corresponding to sulfapyridine is not greater than 0.5 times the area of the second peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Chlorides (2.4.4). To 1.25 g add 50 ml of *distilled water R*. Heat at about 70 °C for 5 min. Cool and filter. To 20 ml of the filtrate add 1 ml of *nitric acid R*, allow to stand for 5 min and filter to obtain a clear solution. 15 ml of the filtrate complies with the limit test for chlorides (140 ppm).

Sulphates (2.4.13). To 20 ml of the filtrate prepared for the test for chlorides add 1 ml of *dilute hydrochloric acid R*, allow to stand for 5 min and filter. 15 ml of the filtrate complies with the limit test for sulphates (400 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 2 h.

Sulphated ash (2.4.14). Not more than 0.5 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 0.1 M *sodium hydroxide* and dilute to 100.0 ml with the same solvent. Transfer 5.0 ml of this solution to a 1000 ml volumetric flask containing about 750 ml of *water R*. Add 20.0 ml of 0.1 M *acetic acid* and

dilute to 1000.0 ml with *water R*. Prepare a standard solution at the same time and in the same manner using 0.150 g of *sulfasalazine CRS*. Measure the absorbance (2.2.25) of the two solutions at the maximum at 359 nm.

Calculate the content of $C_{18}H_{14}N_4O_5S$ from the absorbances measured and the concentration of the solutions.

STORAGE

Store protected from light.

IMPURITIES

A. 4,4'-[(4-hydroxy-1,3-phenylene)bis(diazenediyl)]bis[*N*-(pyridin-2-yl)benzenesulphonamide],

B. 2-hydroxy-3,5-bis[2-[4-(pyridin-2-ylsulphamoyl)phenyl]diazenyl]benzoic acid,

C. 2-hydroxy-5-[2-[4-(2-aminopyridin-1(2*H*)-yl)phenyl]diazenyl]benzoic acid,

D. 4-[2-(2-hydroxyphenyl)diazenyl]-*N*-(pyridin-2-yl)benzenesulphonamide,

E. 2-hydroxy-4'-(pyridin-2-ylsulphamoyl)-5-[2-[4-(pyridin-2-ylsulphamoyl)phenyl]diazenyl]biphenyl-3-carboxylic acid,

F. 2-hydroxy-3-[2-[4-(pyridin-2-ylsulphamoyl)phenyl]diazenyl]benzoic acid,

G. 5-[2-[4',5-bis(pyridin-2-ylsulphamoyl)biphenyl-2-yl]diazenyl]-2-hydroxybenzoic acid,

H. salicylic acid,

I. 2-hydroxy-5-[2-(4-sulphophenyl)diazenyl]benzoic acid.

01/2005:0742

SULFATHIAZOLE

Sulfathiazolum

$C_9H_9N_3O_2S_2$

M_r 255.3

DEFINITION

Sulfathiazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(thiazol-2-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, practically insoluble in water, slightly soluble in alcohol, practically insoluble in methylene chloride. It dissolves in dilute solutions of alkali hydroxides and in dilute mineral acids.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

- Melting point (2.2.14): 200 °C to 203 °C. Melting may occur at about 175 °C, followed by solidification and a second melting between 200 °C and 203 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfathiazole CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *alcohol R*, evaporate to dryness *in vacuo* and record the spectra again using the residues.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

D. Dissolve about 10 mg in a mixture of 10 ml of *water R* and 2 ml of 0.1 *M sodium hydroxide* and add 0.5 ml of *copper sulphate solution R*. A greyish-blue or purple precipitate is formed.

E. Dissolve about 5 mg in 10 ml of 1 *M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further addition of acid, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of 1 *M sodium hydroxide*. The solution is clear (2.2.1) and not more intensely coloured than reference solution GY₄ (2.2.2, *Method II*).

Acidity. To 1.0 g add 50 ml of *carbon dioxide-free water R*. Heat to 70 °C for 5 min. Cool rapidly to 20 °C and filter. To 25 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of 0.1 *M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel H R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 5 ml with a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R*.

Reference solution (a). Dissolve 20 mg of *sulfathiazole CRS* in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 50 mg of *sulfanilamide R* in a mixture of 1 volume of *concentrated ammonia R* and 9 volumes of *alcohol R* and dilute to 100 ml with the same mixture of solvents. Dilute 1 ml of this solution to 10 ml with the same mixture of solvents.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 18 volumes of *ammonia R* and 90 volumes of *butanol R*. Dry the plate at 100 °C to 105 °C for 10 min and spray with a 1 g/l solution of *dimethylaminobenzaldehyde R* in *alcohol R* containing 1 per cent *V/V* of *hydrochloric acid R*. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (2.5.8), using 0.200 g, determining the end-point electrometrically.

1 ml of 0.1 *M sodium nitrite* is equivalent to 25.53 mg of $C_9H_9N_3O_2S_2$.

STORAGE

Store protected from light.

01/2005:0790

SULFINPYRAZONE

Sulfinpyrazonum

 $C_{23}H_{20}N_2O_3S$ M_r 404.5

DEFINITION

Sulfinpyrazone contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1,2-diphenyl-4-[2-(phenylsulphonyl)ethyl]pyrazolidine-3,5-dione, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, sparingly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- A. Melting point (2.2.16): 131 °C to 135 °C.
- B. Dissolve 30.0 mg in 0.01 M sodium hydroxide and dilute to 100.0 ml with the same alkaline solution. Dilute 1.0 ml of this solution to 20.0 ml with 0.01 M sodium hydroxide. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 260 nm. The specific absorbance at the maximum is 530 to 580.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfinpyrazone CRS*. Examine the substances prepared as discs.
- D. Dissolve about 10 mg in 3 ml of *acetone R* and add a mixture of 0.2 ml of *ferric chloride solution R2* and 3 ml of *water R*. A red to violet colour develops.

TESTS

Appearance of solution in acetone. Dissolve 1.25 g in *acetone R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1). The absorbance (2.2.25) of the solution, measured at 420 nm with a path-length of 4 cm, is not greater than 0.10.

Appearance of solution in 1 M sodium hydroxide. Dissolve 1.25 g, heating gently if necessary, in 25 ml of 1 M sodium hydroxide. The solution is clear (2.2.1). The absorbance (2.2.25) of the solution, measured at 420 nm with a path-length of 4 cm, is not greater than 0.15.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. Expose the plate, in a tank, to the vapour from *glacial acetic acid R*. After 10 min, remove the plate and heat at 60 °C for 40 min. Cool and pass a current of nitrogen over the plate for 10 min. Prepare the solutions immediately before use.

Test solution. Dissolve 0.25 g of the substance to be examined in *acetone R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dilute 2 ml of the test solution to 100 ml with *acetone R*. Dilute 1 ml of this solution to 10 ml with *acetone R*.

Reference solution (b). Dissolve 10 mg of *sulfinpyrazone impurity A CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *acetone R*.

Reference solution (d). Dissolve 10 mg of *sulfinpyrazone impurity B CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (e). Dilute 5 ml of reference solution (d) to 10 ml with *acetone R*.

Apply to the plate, under an atmosphere of nitrogen, 2 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R* and 80 volumes of *chloroform R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution: any spots corresponding to sulfinpyrazone impurity A and sulfinpyrazone impurity B are not more intense than the spots in the chromatograms obtained with reference solutions (b) (2.0 per cent) and (d) (2.0 per cent), respectively, and at most one of the spots is more intense than the corresponding spot in the chromatogram obtained with reference solution (c) (1.0 per cent) or (e) (1.0 per cent); any spot apart from the principal spot and the two spots previously cited is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 25 ml of *acetone R*. Add 0.5 ml of *bromothymol blue solution R1*. Titrate with 0.1 M sodium hydroxide until the colour changes from yellow to blue.

1 ml of 0.1 M sodium hydroxide is equivalent to 40.45 mg of $C_{23}H_{20}N_2O_3S$.

STORAGE

Store protected from light.

IMPURITIES

- A. X = SO₂: 1,2-diphenyl-4-[2-(phenylsulphonyl)ethyl]pyrazolidine-3,5-dione,
- B. X = S: 1,2-diphenyl-4-[2-(phenylsulphanyl)ethyl]pyrazolidine-3,5-dione.

01/2005:0639 *Test solution (b).* Dilute 1 ml of test solution (a) to 5 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

SULFISOMIDINE

Sulfisomidinum

$C_{12}H_{14}N_4O_2S$

M_r 278.3

DEFINITION

Sulfisomidine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-amino-*N*-(2,6-dimethylpyrimidin-4-yl)benzenesulphonamide, calculated with reference to the dried substance.

CHARACTERS

White or yellowish-white powder or crystals, very slightly soluble in water, slightly soluble in acetone and in alcohol. It dissolves in dilute solutions of the alkali hydroxides and in dilute mineral acids.

It melts at about 240 °C with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulfisomidine CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve 50 mg with heating in 4 ml of *methanol R*. Cool and filter. Add to the filtrate 0.2 ml of a 40 g/l solution of *copper acetate R*. The solution becomes yellowish-green.
- Dissolve about 5 mg in 10 ml of 1 *M hydrochloric acid*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution, without further acidification, gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in a mixture of 5 ml of *dilute sodium hydroxide solution R* and 5 ml of *water R*. The solution is not more intensely coloured than reference solution Y₅, BY₅ or GY₅ (2.2.2, *Method II*).

Acidity. To 1.25 g, finely powdered, add 25 ml of *carbon dioxide-free water R*. Heat at 70 °C for 5 min. Cool in a bath of iced water for about 15 min and filter. To 20 ml of the filtrate add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.1 *M sodium hydroxide* is required to change the colour of the indicator.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20 mg of *sulfisomidine CRS* in 3 ml of a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.25 ml of test solution (b) to 50 ml with a mixture of 2 volumes of *concentrated ammonia R* and 48 volumes of *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 3 volumes of *dilute ammonia R1*, 5 volumes of *water R*, 40 volumes of *nitromethane R* and 50 volumes of *dioxan R*. Dry the plate at 100 °C to 105 °C and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Carry out the determination of primary aromatic amino-nitrogen (2.5.8), using 0.2500 g and determining the end-point electrometrically.

1 ml of 0.1 *M sodium nitrite* is equivalent to 27.83 mg of $C_{12}H_{14}N_4O_2S$.

STORAGE

Store protected from light.

01/2005:0864

SULINDAC

Sulindacum

$C_{20}H_{17}FO_3S$

M_r 356.4

DEFINITION

Sulindac contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (*Z*)-[5-fluoro-2-methyl-1-[4-(methylsulphonyl)benzylidene]-1*H*-inden-3-yl]acetic acid, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder, very slightly soluble in water, soluble in methylene chloride, sparingly soluble in alcohol. It dissolves in dilute solutions of alkali hydroxides.

It shows polymorphism.

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 182 °C to 186 °C.
- B. Dissolve 50 mg in a 0.3 per cent V/V solution of *hydrochloric acid R* in *methanol R* and dilute to 100 ml with the same acid solution. Dilute 2 ml of the solution to 50 ml with a 0.3 per cent V/V solution of *hydrochloric acid R* in *methanol R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows 2 absorption maxima, at 284 nm and 327 nm, and a shoulder at about 258 nm. The ratio of the absorbance measured at the maximum at 284 nm to that measured at the maximum at 327 nm is 1.10 to 1.20.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulindac CRS*. Examine the substances prepared as discs. If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of hot *methanol R*, evaporate to dryness and record new spectra using the residues.
- D. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.
- Test solution.* Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *sulindac CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *diflunisal CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 2 ml with reference solution (a).

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 49 volumes of *methylene chloride R* and 50 volumes of *acetone R*. Dry the plate in a current of warm air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

- E. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. Add 1.0 ml of the filtrate to a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 5.0 ml to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 20.0 mg of *sulindac CRS* (which has an assigned content of *E*-isomer) in the mobile phase and dilute to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *silica gel for chromatography R* (10 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture of 1 volume of *glacial acetic acid R*, 4 volumes of *alcohol R*, 100 volumes of *ethyl acetate R* and 400 volumes of *ethanol-free chloroform R*,
- as detector a spectrophotometer set at 280 nm.

Inject 20 µl of reference solution (a) and adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 20 µl of reference solution (b) and continue the chromatography for twice the retention time of the principal peak. The chromatogram obtained shows a principal peak corresponding to sulindac and a peak corresponding to the *E*-isomer, with a retention time relative to sulindac of about 1.75.

Inject 20 µl of the test solution, 20 µl of reference solution (a) and 20 µl of reference solution (b). From the chromatograms obtained with the test solution and reference solution (b), determine the percentage content of *E*-isomer, taking into account the assigned content of this isomer in *sulindac CRS*: the value found is not more than 0.5 per cent. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak and any peak corresponding to *E*-isomer, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent).

Heavy metals (2.4.8). 2.0 g complies with limit test D (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C at a pressure not exceeding 700 Pa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of *methanol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 35.64 mg of C₂₀H₁₇FO₃S.

STORAGE

Protected from light.

IMPURITIES

- A. (*E*)-[5-fluoro-2-methyl-1-[4-(methylsulphonyl)benzylidene]-1*H*-inden-3-yl]acetic acid,

- B. X = SO₂: (*Z*)-[5-fluoro-2-methyl-1-[4-(methylsulphonyl)benzylidene]-1*H*-inden-3-yl]acetic acid,
C. X = S: (*Z*)-[5-fluoro-2-methyl-1-[4-(methylsulphanyl)benzylidene]-1*H*-inden-3-yl]acetic acid.

01/2005:0953

SULPHUR FOR EXTERNAL USE

Sulfur ad usum externum

S

A, 32.07

DEFINITION

Sulphur contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of S.

CHARACTERS

A yellow powder, practically insoluble in water, soluble in carbon disulphide, slightly soluble in vegetable oils. The size of most of the particles is not greater than 20 µm and that of almost all the particles is not greater than 40 µm.

It melts at about 120 °C.

IDENTIFICATION

- A. Heated in the presence of air, it burns with a blue flame, emitting sulphur dioxide which changes the colour of moistened *blue litmus paper R* to red.
B. Heat 0.1 g with 0.5 ml of *bromine water R* until decolourised. Add 5 ml of *water R* and filter. The solution gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. To 5 g add 50 ml of *carbon dioxide-free water R* prepared from *distilled water R*. Allow to stand for 30 min with frequent shaking and filter.

Appearance of solution. Solution S is colourless (2.2.2, *Method II*).

Odour (2.3.4). The substance to be examined has no perceptible odour of hydrogen sulphide.

Acidity or alkalinity. To 5 ml of solution S add 0.1 ml of *phenolphthalein solution R1*. The solution is colourless. Add 0.2 ml of 0.01 *M sodium hydroxide*. The solution is red. Add 0.3 ml of 0.01 *M hydrochloric acid*. The solution is colourless. Add 0.15 ml of *methyl red solution R*. The solution is orange-red.

Chlorides (2.4.4). Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (100 ppm).

Sulphides. To 10 ml of solution S add 2 ml of *buffer solution pH 3.5 R* and 1 ml of a freshly prepared 1.6 g/l solution of *lead nitrate R* in *carbon dioxide-free water R*. Shake. After 1 min any colour in the solution is not more intense than that in a reference solution prepared at the same time using 1 ml of *lead standard solution (10 ppm Pb) R*, 9 ml of *carbon dioxide-free water R*, 2 ml of *buffer solution pH 3.5 R* and 1.2 ml of *thioacetamide reagent R*.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Carry out the oxygen-flask method (2.5.10), using 60.0 mg of the substance to be examined in a 1000 ml combustion flask. Absorb the combustion products in a mixture of 5 ml of *dilute hydrogen peroxide solution R* and 10 ml of *water R*. Heat to boiling, boil gently for 2 min and cool. Using 0.2 ml of *phenolphthalein solution R* as indicator, titrate with 0.1 *M sodium hydroxide* until the colour changes from colourless to red. Carry out a blank titration under the same conditions.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 1.603 mg of S.

STORAGE

Store protected from light.

01/2005:1572

SULPHURIC ACID

Acidum sulfuricum

H₂SO₄M_r 98.1

DEFINITION

Sulphuric acid contains not less than 95.0 per cent *m/m* and not more than 100.5 per cent *m/m* of H₂SO₄.

CHARACTERS

A colourless, oily liquid, very hygroscopic, miscible with water and with alcohol producing intense heat.

The relative density is about 1.84.

IDENTIFICATION

- A. Carefully add 1 ml to 100 ml of *water R*. The solution is strongly acid (2.2.4).
B. The solution obtained in identification test A gives reaction (a) of sulphates (2.3.1).

TESTS

Appearance of solution. Carefully pour, while cooling, 5 ml into 30 ml of *water R* and dilute to 50 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Chlorides (2.4.4). Mix carefully, while cooling, 3.3 g with 30 ml of *water R*. Neutralise with *ammonia R* and dilute to 50 ml with *water R*. 15 ml of the solution complies with the limit test for chlorides (50 ppm).

Nitrates. Add 5 ml to 5 ml of *water R*. Cool to room temperature and add 0.5 ml of *indigo carmine solution R*. The blue colour persists for at least 1 min.

Arsenic (2.4.2). Mix, while cooling, 1 g with 20 ml of *water R* and dilute to 25 ml with the same solvent. The solution complies with limit test A for arsenic (1 ppm).

Iron (2.4.9). Cautiously evaporate 10.0 g and ignite to dull redness. Dissolve the ignition residue in 1 ml of *dilute hydrochloric acid R* with gentle heating and dilute to 25 ml with *water R*. Dilute 1 ml of the solution to 10 ml with *water R*. The solution complies with the limit test for iron (25 ppm).

Heavy metals (2.4.8). 4.0 g complies with limit test F for heavy metals (5 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

ASSAY

Weigh accurately a ground-glass-stoppered flask containing 30 ml of *water R*. Introduce 0.2 ml of the acid, cool and weigh again. Titrate with 1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 1 M *sodium hydroxide* is equivalent to 49.04 mg of H_2SO_4 .

STORAGE

Store in an airtight container.

01/2005:1045

SULPIRIDE

Sulpiridum

$\text{C}_{15}\text{H}_{23}\text{N}_3\text{O}_4\text{S}$

M_r 341.4

DEFINITION

Sulpiride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (*RS*)-*N*[(1-ethylpyrrolidin-2-yl)methyl]-2-methoxy-5-sulphamoylbenzamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in methanol, slightly soluble in alcohol and in methylene chloride. It dissolves in dilute solutions of mineral acids and alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 177 °C to 181 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *sulpiride CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in test A for related substances (see Tests) in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. To about 1 mg in a porcelain dish, add 0.5 ml of *sulphuric acid R* and 0.05 ml of *formaldehyde solution R*. Examined in ultraviolet light at 365 nm, the solution shows blue fluorescence.

TESTS

Appearance of solution. Dissolve 1.0 g in *dilute acetic acid R* and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method I*).

Related substances

A. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *sulpiride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *sulpiride impurity A CRS* in *methanol R* and dilute to 25 ml with the same solvent.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 10 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 2 volumes of *concentrated ammonia R*, 10 volumes of *dioxan R*, 14 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm for identification test C and then spray with *ninhydrin solution R*. Heat at 100-105 °C for 15 min. Examine in daylight. Any spot in the chromatogram obtained with test solution (a) corresponding to the principal spot in the chromatogram obtained with reference solution (b) is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

B. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *sulpiride CRS* and 10 mg of *sulpiride impurity B CRS* in the mobile phase and dilute to 100.0 ml with the same solvent.

The chromatography may be carried out using:

- a column 0.25 m long and 4.6 mm in internal diameter, packed with *octylsilyl silica gel for chromatography R* (5 µm) in spherical micro-particles,
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 10 volumes of *acetonitrile R*, 10 volumes of *methanol R* and 80 volumes of a solution containing 6.8 g/l of *potassium dihydrogen phosphate R* and 1 g/l of *sodium octanesulphonate R*, adjusted to pH 3.3 using *phosphoric acid R*,
- as detector a spectrophotometer set at 240 nm,
- a loop injector.

Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (a) is not less than 5 per cent of the full scale of the recorder. Inject 10 µl of reference solution (b). The test is not valid unless in the chromatogram obtained the resolution between the two principal peaks is at least 2.5. Inject separately 10 µl of the test solution and 10 µl of reference solution (a). Continue the chromatography for 2.5 times the retention time of sulpiride. In the chromatogram obtained with the test solution, the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.3 per cent).

Chlorides (2.4.4). Shake 1.0 g with 20 ml of *water R*. Filter through a sintered-glass filter (40). To 10 ml of the solution add 5 ml of *water R*. The solution complies with the limit test for chlorides (100 ppm).

Iron (2.4.9). Ignite 1.0 g in a silica crucible. To the residue add 1 ml of 1 M *hydrochloric acid*, 3 ml of *water R* and 0.1 ml of *nitric acid R*. Heat on a water-bath for a few minutes. Place the solution in a test-tube. Rinse the crucible with 4 ml of *water R*. Collect the rinsings in the test-tube and dilute to 10 ml with *water R*. The solution complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 80 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 34.14 mg of C₁₅H₂₃N₃O₄S.

IMPURITIES

A. [(2*RS*)-1-ethylpyrrolidin-2-yl]methanamine,

B. R = O-CH₃: methyl 2-methoxy-5-sulphamoylbenzoate,

C. R = O-C₂H₅: ethyl 2-methoxy-5-sulphamoylbenzoate,

D. R = OH: 2-methoxy-5-sulphamoylbenzoic acid,

E. R = NH₂: 2-methoxy-5-sulphamoylbenzamide,

F. 1-ethyl-2-[[[(2-methoxy-5-sulphamoylbenzoyl)amino]methyl]pyrrolidine 1-oxide,

and enantiomer

G. (*RS*)-*N*-[(1-ethylpyrrolidin-2-yl)methyl]-2-hydroxy-5-sulphamoylbenzamide.

01/2005:1573

SUMATRIPTAN SUCCINATE

Sumatriptani succinas

C₁₈H₂₇N₃O₆S

*M*_r 413.5

DEFINITION

[3-[2-(Dimethylamino)ethyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide hydrogen butanedioate.

Content: 97.5 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white to almost white powder.

Solubility: freely soluble in water, sparingly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: *sumatriptan succinate CRS*.

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

pH (2.2.3): 4.5 to 5.3.

Dilute 2.5 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Absorbance (2.2.25): maximum 0.10, measured at 440 nm on solution S.

Impurity A and impurity H. Liquid chromatography (2.2.29).

Test solution. Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 2 mg of *sumatriptan impurity A CRS* in the mobile phase, add 1 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 1 ml to 10 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 3 mg of *sumatriptan for system suitability CRS* in the mobile phase and dilute to 1 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *silica gel for chromatography R* (5 μ m).

Mobile phase: mix 10 volumes of a 771 g/l solution of *ammonium acetate R* and 90 volumes of *methanol R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 282 nm.

Injection: 20 μ l.

Run time: 5 times the retention time of sumatriptan.

System suitability:

- resolution: minimum of 1.5 between the peaks due to sumatriptan and to impurity A in the chromatogram obtained with reference solution (a),
- the chromatogram obtained with reference solution (c) is similar to the chromatogram provided with *sumatriptan for system suitability CRS*.

Limits:

- *impurity A*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
- *impurity H*: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent).

Related substances. Liquid chromatography (2.2.29).

Solution A. Dissolve 2.925 g of *sodium dihydrogen phosphate R* in 600 ml of *water R*, adjust to pH 6.5 with *strong sodium hydroxide solution R*, dilute to 750 ml with *water R*, add 250 ml of *acetonitrile R* and mix.

Test solution (a). Dissolve 30.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Test solution (b). Dissolve 15.0 mg of the substance to be examined in solution A and dilute to 100.0 ml with solution A.

Reference solution (a). Dissolve 2 mg of *sumatriptan impurity C CRS* in the mobile phase, add 1 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 1 ml to 10 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 30 mg of *sumatriptan impurity mixture CRS* in the mobile phase and dilute to 10 ml with the mobile phase.

Reference solution (d). Dissolve 2 mg of *sumatriptan impurity D CRS* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 1 ml to 10 ml with the mobile phase.

Reference solution (e). Dissolve 15.0 mg of *sumatriptan succinate CRS* in solution A and dilute to 100.0 ml with solution A.

Reference solution (f). Dissolve 3 mg of *sumatriptan impurity C CRS* in solution A, add 40 ml of reference solution (e) and dilute to 100 ml with solution A.

Column:

- size: $l = 0.25$ m, $\varnothing = 4$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: mix 25 volumes of *acetonitrile R* with 75 volumes of a solution prepared as follows: dissolve 0.970 g of *dibutylamine R*, 0.735 g of *phosphoric acid R* and 2.93 g of *sodium dihydrogen phosphate R* in 750 ml of *water R*, adjust to pH 6.5 with *strong sodium hydroxide solution R* and dilute to 1000 ml with *water R*.

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 282 nm.

Injection: 10 μ l; inject test solution (a) and reference solutions (a), (b), (c) and (d).

Run time: 4 times the retention time of sumatriptan.

System suitability:

- resolution: minimum of 1.5 between the peaks due to sumatriptan and to impurity C in the chromatogram obtained with reference solution (a),
- the chromatogram obtained with reference solution (c) shows 5 clearly separated peaks.

Limits:

The chromatogram obtained with reference solution (c) shows 5 peaks: 1 major peak due to sumatriptan, 3 peaks of about equal area due to impurities B, C and D and 1 peak due to impurity E with an area of about twice the area of the peaks due to impurities B, C or D.

Determine the retention times of impurities B, C, D and E using the chromatograms obtained with reference solutions (a), (c) and (d).

- *impurities B, C, D*: for each impurity, not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *impurity E or any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- *total*: not more than 6 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): maximum 1.0 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances.

Injection: 10 μ l; inject test solution (b) and reference solutions (e) and (f).

System suitability: reference solution (f):

- resolution: minimum of 1.5 between the peaks due to sumatriptan and to impurity C.

Calculate the percentage content of sumatriptan succinate using the chromatogram obtained with reference solution (e).

STORAGE

Protected from light.

IMPURITIES

- A. [3-[2-(dimethylamino)ethyl]-2-[[3-[2-(dimethylamino)ethyl]-1*H*-indol-5-yl]methyl]-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide,

- B. R1 = R2 = H: *N*-methyl[3-[2-(methylamino)ethyl]-1*H*-indol-5-yl]methanesulphonamide,
 C. R1 = CH₂-OH, R2 = CH₃: [3-[2-(dimethylamino)ethyl]-1-(hydroxymethyl)-1*H*-indol-5-yl]-*N*-methylmethanesulphonamide,

SUNFLOWER OIL, REFINED

Helianthi annui oleum raffinatum

DEFINITION

Sunflower oil is the fatty oil obtained from the seeds of *Helianthus annuus* L. by mechanical expression or by extraction. It is then refined. A suitable antioxidant may be added.

CHARACTERS

A clear, light yellow liquid, practically insoluble in water and in alcohol, miscible with light petroleum (bp: 40 °C to 60 °C).

It has a relative density of about 0.921 and a refractive index of about 1.474.

IDENTIFICATION

Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the typical chromatogram for sunflower oil.

TESTS

Acid value (2.5.1). Not more than 0.5, determined on 10.0 g.

Peroxide value (2.5.5). Not more than 10.0.

Unsaponifiable matter (2.5.7). Not more than 1.5 per cent, determined on 5.0 g.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids (2.4.22, *Method A*). The fatty-acid fraction of the oil has the following composition:

- *palmitic acid*: 4.0 per cent to 9.0 per cent,
- *stearic acid*: 1.0 per cent to 7.0 per cent,
- *oleic acid*: 14.0 per cent to 40.0 per cent,
- *linoleic acid*: 48.0 per cent to 74.0 per cent.

STORAGE

Store in an airtight, well-filled container, protected from light.

LABELLING

The label states:

- the name and concentration of any added antioxidant,
- whether the oil is obtained by mechanical expression or by extraction.

01/2005:0248

SUXAMETHONIUM CHLORIDE

Suxamethonii chloridum

 $C_{14}H_{30}Cl_2N_2O_4 \cdot 2H_2O$ M_r 397.3

DEFINITION

Suxamethonium chloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 2,2'-[butanedioylbis(oxy)]bis(*N,N,N*-trimethylethanaminium) dichloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, freely soluble in water, slightly soluble in alcohol.

It melts at about 160 °C, determined without previous drying.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *suxamethonium chloride CRS*. Examine the substances prepared as discs.
- To 1 ml of solution S (see Tests) add 9 ml of *water R*, 10 ml of *dilute sulphuric acid R* and 30 ml of *ammonium reineckate solution R*. A pink precipitate is formed. Allow to stand for 30 min, filter, wash with *water R*, with *alcohol R* and then with *ether R* and dry at 80 °C. The melting point (2.2.14) of the precipitate is 180 °C to 185 °C.
- Dissolve about 25 mg in 1 ml of *water R* and add 0.1 ml of a 10 g/l solution of *cobalt chloride R* and 0.1 ml of *potassium ferrocyanide solution R*. A green colour is produced.
- About 20 mg gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). Dilute 4 ml of solution S to 10 ml with *water R*. The solution is colourless (2.2.2, *Method II*).

pH (2.2.3). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 4.0 to 5.0.

Choline chloride. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R1* as the coating substance.

Test solution. Dissolve 0.4 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.4 g of *suxamethonium chloride CRS* and 2 mg of *choline chloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Apply to the plate 5 µl of each solution. Prepare the mobile phase as follows: shake together for 10 min, 10 volumes of *anhydrous formic acid R*, 40 volumes of *water R* and 50 volumes of *butanol R*; allow to stand and use the upper layer. Develop over a path of 15 cm. Dry the plate in a

current of air and spray with *potassium iodobismuthate solution R*. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot corresponding to choline chloride in the chromatogram obtained with the reference solution (0.5 per cent). The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated spots.

Water (2.5.12). 8.0 per cent to 10.0 per cent, determined on 0.30 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 50 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 18.07 mg of $C_{14}H_{30}Cl_2N_2O_4$.

STORAGE

Store in an airtight container, protected from light.

01/2005:1574

SUXIBUZONE

Suxibuzonium

 $C_{24}H_{26}N_2O_6$ M_r 438.5

DEFINITION

4-[(4-Butyl-3,5-dioxo-1,2-diphenylpyrazolidin-4-yl)methoxy]-4-oxobutanoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in acetone, soluble in alcohol, practically insoluble in cyclohexane.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *suxibuzone CRS*.

TESTS

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Dissolve 1 g in *ethanol R* and dilute to 20 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.10 g of the substance to be examined in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 2.8 mg of *phenylbutazone CRS* (impurity A of *suxibuzone*), 2.8 mg of *suxibuzone impurity B CRS* and 2.8 mg of

suxibuzone impurity C CRS in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 4 mg of *phenylbutazone CRS* (impurity A of *suxibuzone*) in *acetonitrile R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile R*.

Reference solution (c). Dissolve 10 mg of *phenylbutazone CRS* (impurity A of *suxibuzone*) in *acetonitrile R* and dilute to 25.0 ml with the same solvent. Mix 10.0 ml of this solution with 1.0 ml of the test solution and dilute the mixture to 25.0 ml with *acetonitrile R*.

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (5 μ m).

Mobile phase: mix 44 volumes of *acetonitrile R* and 56 volumes of a solution prepared as follows: dissolve 6.7 g of *citric acid R* and 2.4 g of *tris(hydroxymethyl)aminomethane R* in 950 ml of *water R*, adjust to pH 3.0 with *citric acid R* and dilute to 1000 ml with *water R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 250 nm.

Injection: 10 μ l.

Relative retention with reference to *suxibuzone* (retention time = about 7 min): impurity C = 0.7; impurity A = 1.4; impurity B = 3.3.

System suitability: reference solution (c):

- **resolution:** minimum of 2.0 between the peaks due to *suxibuzone* and to impurity A.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.7 per cent),
- **impurity B:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.7 per cent),
- **impurity C:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.7 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 10 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **disregard limit:** 0.1 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (0.07 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 mg of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven *in vacuo* at 60 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in previously neutralised *ethanol R* and dilute to 10 ml with the same solvent. Carry out a potentiometric titration (2.2.20) using 0.1 M *sodium hydroxide*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 43.85 mg of $C_{24}H_{26}N_2O_6$.

STORAGE

Protected from light.

IMPURITIES

A. *phenylbutazone*,

B. R = $CO-CH_2-CH_2-CO-O-CH_2-CH_3$: (4-butyl-3,5-dioxo-1,2-diphenylpyrazolidin-4-yl)methyl ethyl butanedioate,

C. R = H: 4-butyl-4-(hydroxymethyl)-1,2-diphenyl-1,2-dihydro-4H-pyrazole-3,5-dione.

01/2005:1811

SWEET ORANGE OIL

Aurantii dulcis aetheroleum

DEFINITION

Essential oil obtained without heating, by suitable mechanical treatment from the fresh peel of the fruit of *Citrus sinensis* (L.) Osbeck (*Citrus aurantium* L. var. *dulcis* L.). A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, pale yellow to orange, mobile liquid, which may become cloudy when chilled.

It has a characteristic odour of fresh orange peel.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Examine the chromatograms obtained in the test for bergapten.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Bergapten: a greenish-yellow fluorescent zone	
	Many blue fluorescent zones
Reference solution	Test solution

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Linalyl acetate: a brownish-orange fluorescent zone	A brown fluorescent zone
	A faint brownish-orange fluorescent zone (linalyl acetate)
	Many orange fluorescent zones
Linalol: a brownish-orange fluorescent zone	A brownish-orange fluorescent zone (linalol)
Bergaptene: a faint greenish-yellow fluorescent zone	Many brownish-orange fluorescent zones
	Many blue fluorescent zones
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.842 to 0.850.

Refractive index (2.2.6): 1.470 to 1.476.

Optical rotation (2.2.7): + 94° to + 99°.

Peroxide value (2.5.5, Method B): maximum 20.

Fatty oils and resinified essential oils (2.8.7). It complies with the test for fatty oils and resinified essential oils.

Bergaptene. Thin-layer chromatography (2.2.27).

Test solution. Dilute 0.2 ml of the substance to be examined in 1 ml of alcohol R.

Reference solution. Dissolve 2 mg of bergaptene R, 10 µl of linalol R and 20 µl of linalyl acetate R in 10 ml of alcohol R.

Plate: TLC silica gel plate R.

Mobile phase: ethyl acetate R, toluene R (15:85 V/V).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 365 nm.

Results A: the chromatogram obtained with the test solution shows no greenish-yellow fluorescent zone present in the chromatogram obtained with the reference solution.

Detection B: spray with anisaldehyde solution R and heat at 100-105 °C for 10 min; examine the plate in ultraviolet light at 365 nm.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dilute 300 µl of the substance to be examined to 1 ml with acetone R.

Reference solution (a). Dilute 10 µl of α-pinene R, 10 µl of β-pinene R, 10 µl of sabinene R, 20 µl of β-myrcene R, 800 µl of limonene R, 10 µl of octanal, 10 µl of decanal R, 10 µl of linalol R, 10 µl of citral R (composed of neral and geranial) and 10 µl of valencene R in 1 ml of acetone R.

Reference solution (b). Dissolve 5 µl of β-pinene R in 10 ml of acetone R. Dilute 0.5 ml to 10 ml with acetone R.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.53$ mm,
- **stationary phase:** macrogol 20 000 R (film thickness 1 µm).

Carrier gas: helium for chromatography R.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 6	50
	6 - 31	50 → 150
	31 - 41	150 → 180
	41 - 55	180
Injection port		250
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: order indicated in the composition of reference solution (a). Record the retention times of these substances.

System suitability: reference solution (a)

- **resolution:** minimum 3.9 between the peaks due to β-pinene and sabinene and minimum 1.5 between the peaks due to valencene and geranial.

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The limits are within the following ranges:

- α-pinene: 0.4 per cent to 0.6 per cent,
- β-pinene: 0.02 per cent to 0.3 per cent,
- sabinene: 0.2 per cent to 1.1 per cent,
- β-myrcene: 1.7 per cent to 2.5 per cent,
- limonene: 92.0 per cent to 97.0 per cent,
- octanal: 0.1 per cent to 0.4 per cent,
- decanal: 0.1 per cent to 0.4 per cent,
- linalol: 0.2 per cent to 0.7 per cent,
- neral: 0.02 per cent to 0.10 per cent,
- valencene: 0.02 per cent to 0.5 per cent,
- geranial: 0.03 per cent to 0.20 per cent.

Disregard limit: area of the peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Residue on evaporation: 1.0 per cent to 5.0 per cent.

Evaporate 5.0 g to dryness on a water-bath and dry at 100-105 °C for 4 h.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

LABELLING

The label states the name and concentration of any added antioxidant.

01/2005:0438

TALC**Talcum****DEFINITION**

Talc is a powdered, selected, natural, hydrated magnesium silicate. Pure talc has the formula $[\text{Mg}_3\text{Si}_4\text{O}_{10}(\text{OH})_2]$; M_r 379.3]. It may contain variable amounts of associated minerals among which chlorites (hydrated aluminium and magnesium silicates), magnesite (magnesium carbonate), calcite (calcium carbonate) and dolomite (calcium and magnesium carbonate) are predominant.

PRODUCTION

Talc derived from deposits that are known to contain associated asbestos is not suitable for pharmaceutical use. The manufacturer is responsible for demonstrating by the test for amphiboles and serpentines that the product is free from asbestos. The presence of amphiboles and of serpentines is revealed by X-ray diffraction or by infrared spectrophotometry (see A and B). If detected, the specific morphological criteria of asbestos are investigated by a suitable method of optical microscopy to determine whether tremolite asbestos or chrysotile is present, as described below.

A. Examine by infrared spectrophotometry (2.2.24). In the range 740 cm^{-1} to 760 cm^{-1} using scale expansion, any absorption band at $758 \pm 1\text{ cm}^{-1}$ may indicate the presence of tremolite or of chlorite. If the absorption band remains after ignition of the substance at $850\text{ }^\circ\text{C}$ for at least 30 min, it indicates the presence of the tremolite. In the range 600 cm^{-1} to 650 cm^{-1} using scale expansion, any absorption band or shoulder may indicate the presence of serpentines. Examine the substance prepared as discs using *potassium bromide R*.

B. Examine by X-ray diffraction employing the following conditions:

- Cu K α monochromatic 40 kV radiation, 24 mA to 30 mA,
- incident slit: 1° ,
- detection slit: 0.2° ,
- goniometer speed: $1/10^\circ$ 20/min,
- scanning range: 10° to 13° 2 θ and 24° to 26° 2 θ ,
- the sample is not oriented.

Place the sample on the sample holder; pack and smooth its surface with a polished glass microscope slide.

Record the diffractograms.

The presence of amphiboles is detected by a diffraction peak at $10.5 \pm 0.1^\circ$ 2 θ , the presence of serpentines is detected by diffraction peaks at $24.3 \pm 0.1^\circ$ 2 θ and at $12.1 \pm 0.1^\circ$ 2 θ .

If, by one of the 2 methods, amphiboles and/or serpentine are detected, examine by a suitable method of optical microscopy to determine the asbestos character.

Examined by optical microscopy, the presence of asbestos is shown if the following criteria are met:

- a range of length to width ratios of 20:1 to 100:1, or higher for fibres longer than 5 μm ,
 - capability of splitting into very thin fibrils,
- and if 2 or more of the following 4 criteria are met:
- parallel fibres occurring in bundles,

- fibre bundles displaying frayed ends,
- fibres in the form of thin needles,
- matted masses of individual fibres and/or fibres showing curvature.

CHARACTERS

A light, homogeneous, white or almost white powder, greasy to the touch (non abrasive), practically insoluble in water, in alcohol and in dilute solutions of acids and alkali hydroxides.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24). The spectrum shows absorption bands at $3677 \pm 2\text{ cm}^{-1}$, at $1018 \pm 2\text{ cm}^{-1}$ and at $669 \pm 2\text{ cm}^{-1}$. Examine the substance as discs prepared using *potassium bromide R*.
- B. In a platinum crucible, melt a mixture of 0.2 g of *anhydrous sodium carbonate R* and 2.0 g of *potassium carbonate R*. To the melted mass add 0.1 g of the substance to be examined and heat until the mixture is completely melted. Allow to cool and transfer the melted mass into an evaporating dish with 50 ml of hot *water R*. Add *hydrochloric acid R* until effervescence ceases. Add 10 ml of *hydrochloric acid R* and evaporate to dryness on a water-bath. Allow to cool. Add 20 ml of *water R*, heat to boiling and filter. (The residue is used for identification test C). To 5 ml of the filtrate add 1 ml of *ammonia R* and 1 ml of *ammonium chloride solution R* and filter. To the filtrate add 1 ml of *disodium hydrogen phosphate solution R*. A white, crystalline precipitate is formed.
- C. The residue obtained in identification test B gives the reaction of silicates (2.3.1).

TESTS

Solution S1. Weigh 10.0 g of the substance to be examined into a conical flask fitted with a reflux condenser, add 50 ml of 0.5 M *hydrochloric acid* gradually while stirring and heat on a water-bath for 30 min. Allow to cool. Transfer the mixture to a beaker and allow the undissolved material to settle. Filter the supernatant through medium-speed filter paper into a 100 ml volumetric flask, retaining as much as possible of the insoluble material in the beaker. Wash the residue and the beaker with 3 quantities, each of 10 ml, of hot *water R*. Wash the filter with 15 ml of hot *water R*, allow the filtrate to cool and dilute to 100.0 ml with the same solvent.

Solution S2. Weigh 0.5 g of the substance to be examined in a 100 ml polytetrafluoroethylene dish, add 5 ml of *hydrochloric acid R*, 5 ml of *lead-free nitric acid R* and 5 ml of *perchloric acid R*. Stir gently then add 35 ml of *hydrofluoric acid R* and evaporate slowly to dryness on a hot plate. To the residue, add 5 ml of *hydrochloric acid R*, cover with a watch-glass, heat to boiling and allow to cool. Rinse the watch-glass and the dish with *water R*. Transfer into a volumetric flask, rinse the dish with *water R* and dilute to 50.0 ml with the same solvent.

pH (2.2.3). The pH of the filtrate obtained in the test for water-soluble substances is 7.0 to 9.0. Read the pH 1 min after inserting the electrode.

Water-soluble substances. To 10.0 g add 50 ml of *carbon dioxide-free water R*, heat to boiling and maintain boiling under a reflux condenser for 30 min. Allow to cool, filter through a medium-speed filter paper and dilute to 50.0 ml with *carbon dioxide-free water R*. Take 25.0 ml of the filtrate, evaporate to dryness and heat at $105\text{ }^\circ\text{C}$ for 1 h. The residue weighs not more than 10 mg (0.2 per cent).

Aluminium. Not more than 2.0 per cent of Al, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. To 5.0 ml of solution S2 add 10 ml of a 25.34 g/l solution of *caesium chloride R*, 10.0 ml of *hydrochloric acid R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 10.0 ml of *hydrochloric acid R* and 10 ml of a 25.34 g/l solution of *caesium chloride R*, introduce respectively 5.0 ml, 10.0 ml, 15.0 ml and 20.0 ml of *aluminium standard solution (100 ppm Al) R* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 309.3 nm, using an aluminium hollow-cathode lamp as the radiation source and a nitrous oxide-acetylene flame.

Calcium. Not more than 0.9 per cent of Ca, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. To 5.0 ml of solution S2 add 10.0 ml of *hydrochloric acid R*, 10 ml of *lanthanum chloride solution R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 10.0 ml of *hydrochloric acid R* and 10 ml of *lanthanum chloride solution R*, introduce respectively 1.0 ml, 2.0 ml, 3.0 ml and 4.0 ml of *calcium standard solution (100 ppm Ca) R1* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 422.7 nm using a calcium hollow-cathode lamp as the radiation source and a nitrous oxide-acetylene flame.

Iron. Not more than 0.25 per cent of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. To 2.5 ml of solution S1, add 50.0 ml of 0.5 M *hydrochloric acid* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 50.0 ml of 0.5 M *hydrochloric acid*, introduce respectively 2.0 ml, 2.5 ml, 3.0 ml and 4.0 ml of *iron standard solution (250 ppm Fe) R* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 248.3 nm using an iron hollow-cathode lamp as the radiation source and an air-acetylene flame. Make a correction using a deuterium lamp.

Lead. Not more than 10 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use solution S1.

Reference solutions. Into 4 identical volumetric flasks, each containing 50.0 ml of 0.5 M *hydrochloric acid*, introduce respectively 5.0 ml, 7.5 ml, 10.0 ml and 12.5 ml of *lead standard solution (10 ppm Pb) R1* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 217.0 nm using a lead hollow-cathode lamp as the radiation source and an air-acetylene flame.

Magnesium. 17.0 per cent to 19.5 per cent of Mg, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dilute 0.5 ml of solution S2 to 100.0 ml with *water R*. To 4.0 ml of the solution, add 10.0 ml of *hydrochloric acid R*, 10 ml of *lanthanum chloride solution R* and dilute to 100.0 ml with *water R*.

Reference solutions. Into 4 identical volumetric flasks, each containing 10.0 ml of *hydrochloric acid R* and 10 ml of *lanthanum chloride solution R*, introduce respectively 2.5 ml, 3.0 ml, 4.0 ml and 5.0 ml of *magnesium standard solution (10 ppm Mg) R1* and dilute to 100.0 ml with *water R*.

Measure the absorbance at 285.2 nm using a magnesium hollow-cathode lamp as the radiation source and an air-acetylene flame.

Loss on ignition. Not more than 7.0 per cent, determined on 1.00 g by ignition to constant weight at 1050-1100 °C.

Microbial contamination. If intended for topical administration, the total viable aerobic count (2.6.12) is not more than a total of 10² aerobic bacteria and fungi per gram. If intended for oral administration, the total viable aerobic count (2.6.12) is not more than a total of 10³ aerobic bacteria and not more than 10² fungi per gram.

LABELLING

The label states, where applicable, that the substance is suitable for oral or topical administration.

01/2005:1046
corrected

TAMOXIFEN CITRATE

Tamoxifeni citras

C₃₂H₃₇NO₈

M_r 563.6

DEFINITION

Tamoxifen citrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-[4-[(Z)-1,2-diphenylbut-1-enyl]phenoxy]-N,N-dimethylethanamine dihydrogen 2-hydroxypropane-1,2,3-tricarboxylate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, soluble in methanol, slightly soluble in acetone.

It shows polymorphism.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Dissolve 20 mg in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *methanol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 237 nm and 275 nm. The ratio of the absorbance measured at the maximum at 237 nm to that measured at the maximum at 275 nm is 1.45 to 1.65.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tamoxifen citrate CRS*. Examine the substances prepared as discs. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *acetone R*, evaporate to dryness and record new spectra using the residues.
- Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *tamoxifen citrate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *tamoxifen citrate CRS* and 10 mg of *clomifene citrate CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *triethylamine R* and 90 volumes of *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- D. Dissolve about 10 mg in 4 ml of *pyridine R* with shaking and add 2 ml of *acetic anhydride R*. A yellow colour is produced. Heat on a water-bath for 2 min. A pink to red colour is produced.

TESTS

***E*-isomer and related substances.** Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 15.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 15.0 mg of *tamoxifen citrate for performance test CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of *water R* containing 0.9 g/l of *sodium dihydrogen phosphate R* and 4.8 g/l of *N,N*-dimethyloctylamine *R*, adjusted to pH 3.0 with *phosphoric acid R*,
- as detector a spectrophotometer set at 240 nm.

Equilibrate the column with the mobile phase at a flow rate of 1.2 ml/min for about 30 min.

Adjust the sensitivity of the system so that the height of the peak due to the *E*-isomer in the chromatogram obtained with 10 µl of reference solution (a) is not less than 40 per cent of the full scale of the recorder. The test is not valid unless the chromatogram obtained resembles that of the specimen chromatogram provided with the *tamoxifen citrate for performance test CRS* in that the resolution between the peaks due to the *E*-isomer and to tamoxifen impurity F is at least three and there is base-line separation of the peak due to tamoxifen impurity F from the following peak of the principal component.

Inject separately 10 µl of the test solution and 10 µl of reference solution (b). Continue the chromatography for twice the retention time of the tamoxifen peak. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.3 times that of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent); the sum of the areas of all the peaks, apart from the principal peak and any peak due to the *E*-isomer, is not greater than 0.5 times the area of the principal peak in the chromatogram of reference solution (b) (0.5 per cent). Disregard any peak

due to the citrate (retention time = about 2.5 min) and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 65 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 75 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* using 0.1 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 56.36 mg of C₃₂H₃₇NO₈.

IMPURITIES

- A. 2-[4-[(*E*)-1,2-diphenylbut-1-enyl]phenoxy]-*N,N*-dimethylethanamine,

- B. R = OH, R' = C₆H₅: 1-[4-[2-(dimethylamino)ethoxy]phenyl]-1,2-diphenylbutan-1-ol,

- G. R + R' = O: (2*RS*)-1-[4-[2-(dimethylamino)ethoxy]phenyl]-2-phenylbutan-1-one,

- C. R = R₂ = H, R₄ = O-CH₂-CH₂-N(CH₃)₂: 2-[4-[(*EZ*)-1,2-diphenylethenyl]phenoxy]-*N,N*-dimethylethanamine,

- D. R = CH₃, R₂ = H, R₄ = O-CH₂-CH₂-N(CH₃)₂: 2-[4-[(*EZ*)-1,2-diphenylprop-1-enyl]phenoxy]-*N,N*-dimethylethanamine,

- E. R = C₂H₅, R₂ = O-CH₂-CH₂-N(CH₃)₂, R₄ = H: 2-[2-[(*EZ*)-1,2-diphenylbut-1-enyl]phenoxy]-*N,N*-dimethylethanamine,

- F. 2-[4-[(*Z*)-1,2-diphenylbut-1-enyl]phenoxy]-*N,N*-methylethanamine.

01/2005:1477 IDENTIFICATION

TANNIC ACID**Tanninum****DEFINITION**

Tannic acid is a mixture of esters of glucose with gallic acid and 3-galloylgallic acid.

CHARACTERS

A yellowish-white or slightly brown amorphous light powder or shiny plates, very soluble in water, freely soluble in acetone, in alcohol and in glycerol (85 per cent), practically insoluble in methylene chloride.

IDENTIFICATION

- A. Dilute 0.1 ml of solution S (see Tests) to 5 ml with *water R*. Add 0.1 ml of *ferric chloride solution R1*. A blackish-blue colour is produced which becomes green on the addition of 1 ml of *dilute sulphuric acid R*.
- B. To 1 ml of solution S, add 3 ml of a 1 g/l solution of *gelatin R*. The mixture becomes turbid and a flocculent precipitate is formed.
- C. Dilute 0.1 ml of solution S to 5 ml with *water R*. Add 0.3 ml of *barium hydroxide solution R*. A greenish-blue precipitate is formed.

TESTS

Solution S. Dissolve 4.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1).

Dextrins, gum, salts, sugars. To 2 ml of solution S, add 2 ml of *alcohol R*. The solution is clear. Add 1 ml of *ether R*. The solution remains clear for at least 10 min.

Resins. To 5 ml of solution S, add 5 ml of *water R*. The mixture remains clear for at least 15 min (2.2.1).

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 0.200 g by drying at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

STORAGE

Store protected from light.

01/2005:0460

TARTARIC ACID**Acidum tartaricum**C₄H₆O₆M_r 150.1**DEFINITION**

Tartaric acid contains not less than 99.5 per cent and not more than the equivalent of 101.0 per cent of (2R,3R)-2,3-dihydroxybutanedioic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, very soluble in water, freely soluble in alcohol.

IDENTIFICATION

- A. Solution S (see Tests) is strongly acid (2.2.4).
- B. It gives the reactions of tartrates (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *distilled water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 5.00 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 12.0 to + 12.8.

Oxalic acid. Dissolve 0.80 g in 4 ml of *water R*. Add 3 ml of *hydrochloric acid R* and 1 g of *zinc R* in granules and boil for 1 min. Allow to stand for 2 min. Collect the liquid in a test-tube containing 0.25 ml of a 10 g/l solution of *phenylhydrazine hydrochloride R* and heat to boiling. Cool rapidly, transfer to a graduated cylinder and add an equal volume of *hydrochloric acid R* and 0.25 ml of a 50 g/l solution of *potassium ferricyanide R*. Shake and allow to stand for 30 min. Any pink colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 4 ml of a 0.1 g/l solution of *oxalic acid R* (350 ppm calculated as anhydrous oxalic acid).

Chlorides (2.4.4). 5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (100 ppm).

Sulphates (2.4.13). 10 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (150 ppm).

Calcium (2.4.3). To 5 ml of solution S add 10 ml of a 50 g/l solution of *sodium acetate R* in *distilled water R*. The solution complies with the limit test for calcium (200 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.2 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.650 g in 25 ml of *water R*. Titrate with 1 M *sodium hydroxide* using 0.5 ml of *phenolphthalein solution R* as indicator, until a pink colour is obtained.

1 ml of 1 M *sodium hydroxide* is equivalent to 75.05 mg of C₄H₆O₆.

01/2005:1837

TEA TREE OIL**Melaleuca aetheroleum****DEFINITION**

Essential oil obtained by steam distillation from the foliage and terminal branchlets of *Melaleuca alternifolia* (Maiden and Betch) Cheel, *M. linariifolia* Smith, *M. dissitiflora* F. Mueller and/or other species of *Melaleuca*.

CHARACTERS

Appearance: clear, mobile, colourless to pale yellow liquid with a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.1 ml of the substance to be examined in 5 ml of *heptane R*.

Reference solution. Dissolve 30 µl of *cineole R*, 60 µl of *terpinen-4-ol R* and 10 mg of *α-terpineol R* in 10 ml of *heptane R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *ethyl acetate R*, *heptane R* (20:80 V/V).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R*. Heat at 100-105 °C for 5-10 min while observing. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Cineole: a violet-brown zone	A violet-brown zone, less intense (cineole)
Terpinen-4-ol: a brownish-violet zone	A brownish-violet zone (terpinen-4-ol)
α-terpineol: a violet or brownish-violet zone	A violet or brownish-violet zone (α-terpineol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.885 to 0.906.

Refractive index (2.2.6): 1.475 to 1.482.

Optical rotation (2.2.7): + 5° to + 15°.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Dissolve 0.15 ml of the substance to be examined in 10 ml of *hexane R*.

Reference solution. Dissolve 5 µl of *α-pinene R*, 5 µl of *sabinene R*, 15 µl of *α-terpinene R*, 5 µl of *limonene R*, 5 µl of *cineole R*, 30 µl of *γ-terpinene R*, 5 µl of *p-cymene R*, 5 µl of *terpinolene R*, 60 µl of *terpinen-4-ol R*, 5 µl of *aromadendrene R* and 5 mg of *α-terpineol R* in 10 ml of *hexane R*.

Column:

- **material:** fused silica,
- **size:** *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- **stationary phase:** *macrogol 20 000 R*.

Carrier gas: *helium for chromatography R*.

Flow rate: 1.3 ml/min.

Split ratio: 1:50.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	50
	1 - 37	50 → 230
	37 - 45	230
Injection port		240
Detector		240

Detection: flame ionisation.

Injection: 1 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- **resolution:** minimum 2.7 between the peaks due to terpinen-4-ol and aromadendrene.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The percentages are within the following ranges:

- *α-pinene*: 1.0 per cent to 6.0 per cent,
- *sabinene*: less than 3.5 per cent,
- *α-terpinene*: 5.0 per cent to 13.0 per cent,
- *limonene*: 0.5 per cent to 4.0 per cent,
- *cineole*: less than 15.0 per cent,
- *γ-terpinene*: 10.0 per cent to 28.0 per cent,
- *p-cymene*: 0.5 per cent to 12.0 per cent,
- *terpinolene*: 1.5 per cent to 5.0 per cent,
- *terpinen-4-ol*: minimum 30.0 per cent,
- *aromadendrene*: less than 7.0 per cent,
- *α-terpineol*: 1.5 per cent to 8.0 per cent.

STORAGE

In an airtight, well-filled container, protected from light, at a temperature not exceeding 25 °C.

01/2005:0954

TEMAZEPAM

Temazepamum

C₁₆H₁₃ClN₂O₂

*M*_r 300.7

DEFINITION

(3*RS*)-7-Chloro-3-hydroxy-1-methyl-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of temazepam.*

TESTS

Impurity A: maximum 0.05 per cent.

Dissolve 0.400 g in *methylene chloride R* and dilute to 20.0 ml with the same solvent. The absorbance (2.2.25) is maximum 0.30 at 409 nm.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 1 volume of *water R* and 9 volumes of *methanol R*. Dilute 2.0 ml of the solution to 10.0 ml with a mixture of 1 volume of *water R* and 9 volumes of *methanol R*.

Reference solution (b). Dissolve 1 mg of *oxazepam R*, 1 mg of *temazepam impurity F CRS* and 1 mg of *temazepam impurity G CRS* in a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 25 ml with the same mixture of solvents.

Reference solution (c). Dissolve 1 mg of *temazepam impurity C CRS* and 1 mg of *temazepam impurity D CRS* with a mixture of 1 volume of *water R* and 9 volumes of *methanol R* and dilute to 25 ml with the same mixture of solvents.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *end-capped octadecylsilyl silica gel for chromatography R* (3.5 μ m).

Mobile phase:

- **mobile phase A:** solution containing 4.9 g/l of *sodium dihydrogen phosphate R* and 0.63 g/l of *disodium hydrogen phosphate R* (pH 5.6),
- **mobile phase B:** *methanol R*,
- **mobile phase C:** *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Mobile phase C (per cent V/V)
0 - 18	54	39	7
18 - 25	54 → 22	39 → 63	7 → 15
25 - 31	22	63	15
31 - 37	22 → 54	63 → 39	15 → 7

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 230 nm.

Injection: 20 μ l.

Relative retention with reference to temazepam (retention time = about 16 min): impurity E = about 0.55; impurity F = about 0.67; impurity G = about 0.73; impurity B = about 0.8; impurity D = about 1.2; impurity C = about 1.3; impurity A = about 1.5.

System suitability: reference solution (b):

- **resolution:** minimum 1.5 between the peaks due to impurity F and impurity G,

- **peak-to-valley ratio:** minimum 1.7, where H_p = height above the baseline of the peak due to impurity G and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to impurity B.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity F = 3.2; impurity G = 3.1;
- **impurities B, C, D, E, F, G:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- **any other impurity:** for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent);
- **disregard limit:** 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *nitroethane R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 30.07 mg of $C_{16}H_{13}ClN_2O_2$.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G.

A. [5-chloro-2-(methylamino)phenyl]phenylmethanone,

B. oxazepam,

and enantiomer

C. R = CO-CH₃: (3*RS*)-7-chloro-1-methyl-2-oxo-5-phenyl-2,3-dihydro-1*H*-1,4-benzodiazepin-3-yl acetate,

D. R = CH₃: (3*RS*)-7-chloro-3-methoxy-1-methyl-5-phenyl-1,3-dihydro-2*H*-1,4-benzodiazepin-2-one,

E. 7-chloro-1-methyl-5-phenyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one 4-oxide,

F. R = H: (5*RS*)-7-chloro-1-methyl-5-phenyl-4,5-dihydro-1*H*-1,4-benzodiazepine-2,3-dione,

G. R = CH₃: (5*RS*)-7-chloro-1,4-dimethyl-5-phenyl-4,5-dihydro-1*H*-1,4-benzodiazepine-2,3-dione.

01/2005:1156

TENOXICAM

Tenoxicamum

C₁₃H₁₁N₃O₄S₂

*M*_r 337.4

DEFINITION

Tenoxicam contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-hydroxy-2-methyl-*N*-(pyridin-2-yl)-2*H*-thieno[2,3-*e*]1,2-thiazine-3-carboxamide 1,1-dioxide, calculated with reference to the anhydrous substance.

CHARACTERS

A yellow, crystalline powder, practically insoluble in water, sparingly soluble in methylene chloride, very slightly soluble in ethanol. It dissolves in solutions of acids and alkalis.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tenoxicam CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *methylene chloride R*, evaporate to dryness on a water-bath and record new spectra using the residues.

TESTS

Appearance of solution. Dissolve 0.10 g in 20 ml of *methylene chloride R*. The solution is clear (2.2.1).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.4 g in a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 20 ml with a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R*. Dilute 1 ml of the solution to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 20 mg of *tenoxicam CRS* and 20 mg of *salicylic acid CRS* in a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents.

Reference solution (c). Dissolve 20 mg of *pyridin-2-amine R* in a mixture of 4 volumes of *concentrated ammonia R* and 96 volumes of *methanol R* and dilute to 5 ml with the same mixture of solvents. Dilute 2 ml of the solution to 50 ml with the same mixture of solvents.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm with a mixture of 5 volumes of *anhydrous formic acid R*, 5 volumes of *methanol R*, 20 volumes of *acetone R* and 70 volumes of *methylene chloride R*. Allow the plate to dry in air. Examine in ultraviolet light at 254 nm. Any spot corresponding to pyridin-2-amine in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). Any spot in the chromatogram obtained with the test solution apart from the principal spot and any spot corresponding to pyridin-2-amine, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Heavy metals (2.4.8). 0.5 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 5 ml of *lead standard solution (2 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 5 ml of *anhydrous formic acid R*. Add 70 ml of *anhydrous acetic acid R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 33.74 mg of C₁₃H₁₁N₃O₄S₂.

STORAGE

Store protected from light.

IMPURITIES

A. pyridin-2-amine,

B. methyl 4-hydroxy-2-methyl-2*H*-thieno[2,3-*e*]1,2-thiazine-3-carboxylate 1,1-dioxide.

01/2005:0690

TERBUTALINE SULPHATE

Terbutalini sulfas

$C_{24}H_{40}N_2O_{10}S$

M_r 548.7

DEFINITION

Terbutaline sulphate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of bis[(1*RS*)-1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]ethanol] sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, slightly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *terbutaline sulphate CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in *aldehyde-free methanol R*, evaporate to dryness and record new spectra using the residues.
- 5 ml of solution S (see Tests) gives reaction (a) of sulphates (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S measured at 400 nm in a 2 cm cell is not greater than 0.11.

Acidity. To 10 ml of solution S add 0.05 ml of *methyl red solution R*. Not more than 1.2 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to yellow.

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 75.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 7.5 mg of *terbutaline impurity C CRS* and 22.5 mg of *terbutaline sulphate CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 2.0 ml of the solution to 20.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1.0 ml/min a solution prepared as follows: dissolve 4.23 g of *sodium hexanesulphonate R* in 770 ml of 0.050 *M ammonium formate* solution prepared as follows: dissolve 3.15 g of *ammonium formate R* in about 980 ml of *water R*; adjust to pH 3.0 by adding about 8 ml of *anhydrous formic acid R* and dilute to 1000 ml with *water R*; then add 230 ml of *methanol R*,
- as detector a spectrophotometer set at 276 nm.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 μ l of reference solution (a). When the chromatograms are recorded under the prescribed conditions, the retention times are: *impurity C* about 9 min and *terbutaline sulphate* about 11 min. The test is not valid unless the resolution between the 2 peaks corresponding to *terbutaline sulphate* and *impurity C* is at least 2.0. If necessary adjust the composition of the mobile phase. Decrease the content of *methanol* to increase the retention time.

Inject 20 μ l of the test solution, 20 μ l of reference solution (a) and 20 μ l of reference solution (b). Continue the chromatography for 6 times the retention time of *terbutaline sulphate*. In the chromatogram obtained with the test solution, the area of any peak corresponding to *impurity C* is not greater than twice that of the corresponding peak in the chromatogram obtained with reference solution (a) (0.2 per cent); the area of any other peak, apart from the principal peak, is not greater than that of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent); the sum of the areas of all the peaks, apart from the principal peak and the peak corresponding to *impurity C*, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard any peak due to the mobile phase and any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 $^\circ$ C for 3 h.

ASSAY

Dissolve 0.400 g in 70 ml of *anhydrous acetic acid R* with heating. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 54.87 mg of $C_{24}H_{40}N_2O_{10}S$.

IMPURITIES

- A. 3,5-dihydroxybenzoic acid (α -resorcylic acid),

- B. (4*RS*)-2-(1,1-dimethylethyl)-1,2,3,4-tetrahydroisoquinoline-4,6,8-triol,

- C. 1-(3,5-dihydroxyphenyl)-2-[(1,1-dimethylethyl)amino]ethanone,

- D. 2-[benzyl-(1,1-dimethylethyl)amino]-1-(3,5-dihydroxyphenyl)ethanone.

01/2005:1270

TERCONAZOLE

Terconazolum

C₂₆H₃₁Cl₂N₅O₃M_r 532.5

DEFINITION

Terconazole contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-[4-[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-[(1*H*-1,2,4-triazol-1-yl)methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)piperazine, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, practically insoluble in water, freely soluble in methylene chloride, soluble in acetone, sparingly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *terconazole CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *acetone R*, evaporate to dryness in a current of air and record new spectra using the residues.

- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable octadecylsilyl silica gel.

Test solution. Dissolve 30 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 30 mg of *terconazole CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 30 mg of *terconazole CRS* and 30 mg of *ketoconazole CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Apply separately to the plate 5 μ l of each solution. Develop in an unsaturated tank over a path of 10 cm using a mixture of 20 volumes of *ammonium acetate solution R*, 40 volumes of *dioxan R* and 40 volumes of *methanol R*. Dry the plate in a current of warm air for 15 min and expose it to iodine vapour until the spots appear. Examine in daylight. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. To 30 mg in a porcelain crucible add 0.3 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Optical rotation (2.2.7). Dissolve 1.0 g in *methylene chloride R* and dilute to 10 ml with the same solvent. The angle of optical rotation is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2.5 mg of *terconazole CRS* and 2.0 mg of *ketoconazole CRS* in *methanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*. Dilute 5.0 ml of this solution to 20.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.1 m long and 4.6 mm in internal diameter packed with *base-deactivated octadecylsilyl silica gel for chromatography R* (3 μ m),
- as mobile phase at a flow rate of 2 ml/min:

Mobile phase A. A 3.4 g/l solution of *tetrabutylammonium hydrogen sulphate R*,

Mobile phase B. *Acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 10	95 → 50	5 → 50	linear gradient
10 - 15	50	50	isocratic elution
15 - 20	95	5	switch to initial eluent composition
20 = 0	95	5	restart gradient

— as detector a spectrophotometer set at 220 nm.

Equilibrate the column for at least 30 min with *acetonitrile R* at a flow rate of 2 ml/min and then equilibrate at the initial elution composition for at least 5 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 10 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 10 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: ketoconazole about 6 min and terconazole about 7.5 min. The test is not valid unless the resolution between the peaks corresponding to ketoconazole and terconazole is at least 13. If necessary, adjust the concentration of acetonitrile in the mobile phase or adjust the time programme for the linear gradient elution.

Inject separately 10 µl of *methanol R* as a blank, 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than that of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak obtained with the blank run and any peak with an area less than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 70 ml of a mixture of 1 volume of *anhydrous acetic acid R* and 7 volumes of *methyl ethyl ketone R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically at the second point of inflexion (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 17.75 mg of C₂₆H₃₁Cl₂N₅O₃.

STORAGE

Store protected from light.

IMPURITIES

- A. 1-[4-[(2*RS*,4*RS*)-2-(2,4-dichlorophenyl)-2-[(1*H*-1,2,4-triazol-1-yl)methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)piperazine,

- B. 1-[4-[(2*RS*,4*SR*)-2-(2,4-dichlorophenyl)-2-[(4*H*-1,2,4-triazol-4-yl)methyl]-1,3-dioxolan-4-yl]methoxy]phenyl]-4-(1-methylethyl)piperazine.

01/2005:0955

TERFENADINE

Terfenadinum

C₃₂H₄₁NO₂

M_r 471.7

DEFINITION

Terfenadine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (1*RS*)-1-[4-(1,1-dimethylethyl)phenyl]-4-[4-(hydroxydiphenylmethyl)piperidin-1-yl]butan-1-ol, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, very slightly soluble in water and in dilute hydrochloric acid, freely soluble in methylene chloride, soluble in methanol.

It shows polymorphism.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

- A. Melting point (2.2.14): 146 °C to 152 °C.
- B. Dissolve 50.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 259 nm and shoulders at 253 nm and 270 nm. The specific absorbance at the maximum is 13.5 to 14.9.
- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *terfenadine CRS*.
- D. Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.
- Test solution.* Dissolve 50 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.
- Reference solution.* Dissolve 50 mg of *terfenadine CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene chloride R*.

Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 15 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 20.0 ml with the mobile phase.

Reference solution (b). Dissolve 15 mg of *terfenadine impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 5.0 ml of the solution, add 5.0 ml of the test solution and dilute to 50.0 ml with the mobile phase.

Reference solution (c). Dilute 10.0 ml of reference solution (a) to 25.0 ml with the mobile phase.

Reference solution (d). Dissolve 0.1 g of *potassium iodide R* in the mobile phase and dilute to 100 ml with the mobile phase. Dilute 1 ml to 100 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture prepared as follows: dilute 600 ml of *acetonitrile R* to 1 litre with *diethylammonium phosphate buffer solution pH 6.0 R*,
- as detector a spectrophotometer set at 217 nm,
- a loop injector.

Inject 20 µl of each solution and continue the chromatography for 5 times the retention time of terfenadine. The test is not valid unless, in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to terfenadine and impurity A is greater than 5.0 and the mass distribution ratio of the peak corresponding to terfenadine is greater than 2.0. Determine the mass distribution ratio using, as unretained compound, *potassium iodide R*. In the chromatogram obtained with the test solution, the area of any peak apart from the principal peak is not greater than that of the peak in the chromatogram obtained with reference solution (c) (0.2 per cent) and the sum of the areas of all the peaks apart from the principal peak is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (0.5 per cent). Disregard any peak with an area less than 2.5 per cent of that of the peak in the chromatogram obtained with reference solution (c).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C under a pressure not exceeding 0.5 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 47.17 mg of C₃₂H₄₁NO₂.

STORAGE

Protected from light.

IMPURITIES

- A. R1 + R2 = O, R3 = OH: 1-[4-(1,1-dimethylethyl)phenyl]-4-[4-(hydroxydiphenylmethyl)piperidin-1-yl]butan-1-one,
- B. R1 = OH, R2 = R3 = H: (1*RS*)-1-[4-(1,1-dimethylethyl)phenyl]-4-[4-(diphenylmethyl)piperidin-1-yl]butan-1-ol,
- H. R1 = R2 = H, R3 = OH: [1-[4-[4-(1,1-dimethylethyl)phenyl]butyl]piperidin-4-yl]diphenylmethanol,

- C. 1-[(4*RS*)-4-[4-(1,1-dimethylethyl)phenyl]-4-hydroxybutyl]-4-(hydroxydiphenylmethyl)piperidine 1-oxide,

- D. (1*RS*)-1-[4-(1,1-dimethylethyl)phenyl]-4-[4-(diphenylmethylene)piperidin-1-yl]butan-1-ol,

- E. R = H: 1-[(4*RS*)-4-[4-(1,1-dimethylethyl)phenyl]-4-hydroxybutyl]piperidine-4-carboxylic acid,
- J. R = C₂H₅: ethyl 1-[(4*RS*)-4-[4-(1,1-dimethylethyl)phenyl]-4-hydroxybutyl]piperidine-4-carboxylate,

F. 1-[4-[4-(1,1-dimethylethyl)phenyl]but-3-enyl]-4-(diphenylmethylene)piperidine,

G. [1-[4-[4-(1,1-dimethylethyl)phenyl]but-3-enyl]piperidin-4-yl]diphenylmethanol,

I. diphenyl(piperidin-4-yl)methanol.

01/2005:1373

TESTOSTERONE

Testosteronum

$C_{19}H_{28}O_2$

M_r 288.4

DEFINITION

17β-Hydroxyandrost-4-en-3-one.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white crystalline powder, or colourless or yellowish-white crystals.

Solubility: practically insoluble in water, freely soluble in alcohol and in methylene chloride, practically insoluble in fatty oils.

mp: about 155 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: testosterone CRS.

TESTS

Specific optical rotation (2.2.7): + 106 to + 114 (dried substance).

Dissolve 0.250 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Impurities D and F. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 1 mg of *stanolone R* in *methanol R* and dilute to 10 ml with the same solvent. In 1 ml of this solution, dissolve 10 mg of *testosterone for impurity D identification CRS* (testosterone spiked with about 1 per cent of impurity D).

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Reference solution (d). Dilute 1.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Plate: TLC silica gel F_{254} plate *R* (6–8 µm).

Preconditioning (in the dark): add about 5 g of powdered *silver nitrate R* to 100 ml of *methanol R*. Stir the suspension for 30 min. Filter or decant the suspension and immerse the plate in the silver nitrate solution for at least 30 min. Dry at 75 °C for 30 min.

A pre-conditioned plate can be stored in the dark for 5–7 days.

Mobile phase: *acetic acid R*, *ethanol R*, *dioxan R*, *methylene chloride R* (1:2:10:90 V/V/V/V).

Application: 2 µl.

Development: in a saturated tank over 3/4 of the plate.

Drying: allow to stand at room temperature and protected from light for 30 min.

Detection: spray with a 200 g/l solution of *toluenesulphonic acid R* in *ethanol R* and heat at 105 °C for 10 min. Examine in ultraviolet light at 365 nm.

System suitability: the chromatogram obtained with reference solution (a) shows 3 clearly separated spots; impurity D R_f = about 0.5; testosterone R_f = about 0.65; impurity F R_f = about 0.7.

Limits:

- *impurity D*: any spot due to impurity D is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent),
- *impurity F*: any spot due to impurity F is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.1 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *testosterone for system suitability CRS* (containing impurities C and I) in 1 ml of *methanol R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *methanol R*. Dilute 1.0 ml of this solution to 10.0 ml with *methanol R*.

Reference solution (c). Dilute 2.0 ml of reference solution (b) to 10.0 ml with *methanol R*.

Column:

- *size*: l = 0.25 m, $\varnothing$ = 4.6 mm,

- *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 µm) with a pore size of 15 nm,
- *temperature*: 40 °C.

Mobile phase:

- *mobile phase A*: water for chromatography *R*, methanol *R* (45:55 V/V),
- *mobile phase B*: methanol *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 4	100	0
4 - 24	100 → 60	0 → 40
24 - 53	60 → 0	40 → 100
53 - 55	0	100
55 - 56	0 → 100	100 → 0
56 - 75	100	0

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Relative retention with reference to testosterone (retention time = about 18 min): impurity G = about 0.6; impurity H = about 0.8; impurity A = about 0.9; impurity I = about 0.95; impurity C = about 1.2; impurity E = about 1.7; impurity J = about 2.1; impurity B = about 2.5.

System suitability: reference solution (a):

- *resolution*: minimum baseline separation between the peaks due to impurity I and testosterone.

Limits: use the chromatogram obtained with reference solution (a) to identify the peaks due to impurities C and I:

- *correction factor*: for the calculation of content, multiply the peak area of impurity I by 2.9,
- *impurity C*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *impurity I*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent),
- *impurities A, B, E, G, H, J*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.1 per cent),
- *total*: not more than 1.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.6 per cent),
- *disregard limit*: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 0.500 g by drying in an oven at 100-105 °C for 2 h.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the absorption maximum at 241 nm.

Calculate the content of C₁₉H₂₈O₂ taking the specific absorbance to be 569.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J.

- A. R1 + R2 = R3 + R4 = O: androst-4-ene-3,17-dione (androstenedione),
- C. R1 + R2 = O, R3 = H, R4 = OH: 17α-hydroxyandrost-4-en-3-one (epitestosterone),
- D. R1 = R3 = OH, R2 = R4 = H: androst-4-ene-3β,17β-diol (Δ4-androstenediol),
- E. R1 + R2 = O, R3 = O-CO-CH₃, R4 = H: 3-oxoandrost-4-en-17β-yl acetate (testosterone acetate),

- B. R = C₂H₅: 3-ethoxyandrost-3,5-dien-17-one (androstenedione ethylenelether),
- J. R = CH₃: 3-methoxyandrost-3,5-dien-17-one (androstenedione methylenelether),

- F. 17β-hydroxy-5α-androstan-3-one (androstanolone, stanolone),

- G. R1 + R2 = O: androsta-1,4-diene-3,17-dione (androstadienedione).
- H. R1 = OH, R2 = H: 17β-hydroxyandrost-1,4-dien-3-one (boldenone),

- I. 17β-hydroxyandrost-4,6-dien-3-one (Δ6-testosterone).

01/2005:1048

TESTOSTERONE ENANTATE

Testosteroni enantas

 $C_{26}H_{40}O_3$ M_r 400.6

DEFINITION

Testosterone enantate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 3-oxoandrost-4-en-17 β -yl heptanoate, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white, crystalline powder, practically insoluble in water, very soluble in ethanol, freely soluble in fatty oils.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 34 °C to 39 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *testosterone enantate CRS*.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable octadecylsilyl silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 5 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dissolve 5 mg of *testosterone enantate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 5 mg of *testosterone enantate CRS*, 5 mg of *testosterone decanoate CRS* and 5 mg of *testosterone isocaproate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Apply separately to the plate 5 μ l of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *water R*, 40 volumes of *acetonitrile R* and 60 volumes of *2-propanol R*. Allow the plate to dry in air and heat at 100 °C for 10 min. Allow to cool and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). Spray the plate with *alcoholic solution of sulphuric acid R*. Heat at 120 °C for 10 min. Allow to cool and examine in daylight. The principal spot in the chromatogram obtained with the test solution is green and is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated principal spots by each method of visualisation.

- D. To about 25 mg add 2 ml of a 10 g/l solution of *potassium hydroxide R* in *methanol R* and boil under a reflux condenser for 1 h. Cool. Add 10 ml of *water R*. Acidify with *dilute hydrochloric acid R* until *blue litmus paper R* turns red. Filter and wash the precipitate with a small quantity of *water R*. The residue, after drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h, melts (2.2.14) at 150 °C to 153 °C.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.250 g in *dioxan R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 77 to + 82, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*.

Reference solution (b). Dissolve 20 mg of *testosterone propionate CRS* in a mixture of 1 volume of *methanol R* and 9 volumes of *methylene chloride R*, add 1 ml of the test solution and dilute to 100 ml with the same mixture of solvents.

Apply separately to the plate 5 μ l of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *ethyl acetate R* and 80 volumes of *toluene R*. Allow the plate to dry in air. Spray with *alcoholic solution of sulphuric acid R* and heat at 120 °C for 10 min. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the principal spot in the chromatogram obtained with reference solution (a) (1.0 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

Testosterone caproate. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *testosterone caproate CRS* in the mobile phase and dilute to 20.0 ml with the mobile phase. Dilute 1.0 ml to 50.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. To 1 ml of this solution add 1 ml of reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.12 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μ m),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 30 volumes of *water R* and 70 volumes of *acetonitrile R*,
- as detector a spectrophotometer set at 240 nm.

Inject 20 μ l of reference solution (b). When using a recorder, adjust the sensitivity of the system so that the height of the two peaks in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram

01/2005:0297

obtained the peak corresponding to testosterone caproate has a retention time of about 0.7 relative to the second peak, which corresponds to testosterone enantate.

Inject 20 µl of the test solution and 20 µl of reference solution (a). In the chromatogram obtained with the test solution, the area of any peak corresponding to testosterone caproate is not greater than the area of the peak in the chromatogram obtained with reference solution (a) (1.0 per cent).

Heptanoic acid. Dissolve 0.50 g of the substance to be examined in 10 ml of *alcohol R* previously neutralised to *bromothymol blue solution R3*. Titrate immediately with 0.01 M sodium hydroxide. Not more than 0.6 ml of 0.01 M sodium hydroxide is required to change the colour of the indicator to blue (0.16 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa.

ASSAY

Dissolve 50.0 mg in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml to 100.0 ml with *ethanol R*. Measure the absorbance (2.2.25) at the maximum at 241 nm.

Calculate the content of $C_{26}H_{40}O_3$ taking the specific absorbance to be 422.

STORAGE

Store protected from light at a temperature of 2 °C to 8 °C.

IMPURITIES

A. heptanoic acid,

B. 3-oxoandrost-4-en-17β-yl hexanoate (testosterone caproate),

C. 3-oxo-5α-androstan-17β-yl heptanoate,

D. 17β-hydroxyandrost-4-en-3-one (testosterone).

TESTOSTERONE PROPIONATE

Testosteroni propionas

 $C_{22}H_{32}O_3$
 M_r 344.5

DEFINITION

3-Oxoandrost-4-en-17β-yl propanoate.

Content: 97.0 per cent to 103.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder or colourless crystals.

Solubility: practically insoluble in water, freely soluble in acetone and in alcohol, soluble in fatty oils.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of testosterone propionate.*

TESTS

Specific optical rotation (2.2.7): + 84 to + 90 (dried substance).

Dissolve 0.250 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of the substance to be examined and 2 mg of *testosterone acetate CRS* in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *methanol R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: water *R*, *methanol R* (20:80 V/V).

Flow rate: 1.5 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl.

Run time: twice the retention time of testosterone propionate.

Relative retention with reference to testosterone propionate (retention time = about 9 min): impurity C = about 0.5; impurity A = about 0.7; impurity D = about 0.8; impurity B = about 1.4.

System suitability: reference solution (a):

- **resolution:** minimum 4.0 between the peaks due to testosterone propionate and to impurity A.

Limits:

- *any impurity*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 0.500 g by drying in an oven at 100–105 °C for 2 h.

ASSAY

Dissolve 25.0 mg in *ethanol R* and dilute to 250.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol R*. Measure the absorbance (2.2.25) at the maximum at 240 nm.

Calculate the content of $C_{22}H_{32}O_3$ taking the specific absorbance to be 490.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E.

- A. R = CO-CH₃: 3-oxoandrost-4-en-17β-yl acetate (testosterone acetate),
- B. R = CO-CH(CH₃)₂: 3-oxoandrost-4-en-17β-yl 2-methylpropanoate (testosterone isobutyrate),
- C. R = H: testosterone,

- D. 3-oxoandrost-1,4-dien-17β-yl propanoate,

- E. 3-oxoandrost-4,6-dien-17β-yl propanoate.

01/2005:0057

TETRACAINE HYDROCHLORIDE

Tetracaini hydrochloridum

 $C_{15}H_{25}ClN_2O_2$ M_r 300.8

DEFINITION

Tetracaine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-(dimethylamino)ethyl 4-(butylamino)benzoate hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, slightly hygroscopic, freely soluble in water, soluble in alcohol.

It melts at about 148 °C or it may occur in either of 2 other crystalline forms which melt respectively at about 134 °C and 139 °C. Mixtures of these forms melt within the range 134 °C to 147 °C.

IDENTIFICATION

First identification: A, B, D.

Second identification: B, C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tetracaine hydrochloride CRS*.
- B. To 10 ml of solution S (see Tests) add 1 ml of *ammonium thiocyanate solution R*. A white, crystalline precipitate is formed which, after recrystallisation from *water R* and drying at 80 °C for 2 h, melts (2.2.14) at about 131 °C.
- C. To about 5 mg add 0.5 ml of *fuming nitric acid R*. Evaporate to dryness on a water-bath, allow to cool and dissolve the residue in 5 ml of *acetone R*. Add 1 ml of 0.1 M *alcoholic potassium hydroxide*. A violet colour develops.
- D. Solution S gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Dilute 2 ml of solution S to 10 ml with *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dilute 1 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of the solution is 4.5 to 6.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*. Carry out a preliminary development over a path of 12 cm using a mixture of 4 volumes of *glacial acetic acid R*, 16 volumes of *hexane R* and 80 volumes of *dibutyl ether R*. Remove the plate and dry it in a current of warm air for a few minutes. Allow the plate to cool before use.

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 50 mg of 4-aminobenzoic acid *R* in *water R* and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *water R*.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 4 volumes of *glacial acetic acid R*, 16 volumes of *hexane R* and 80 volumes of *dibutyl ether R*. Dry the plate at 100 °C to 105 °C for 10 min and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.05 per cent). The principal spot in the chromatogram obtained with the test solution remains at the starting point.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb R)*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 30.08 mg of C₁₅H₂₅ClN₂O₂.

STORAGE

Store protected from light.

01/2005:0644

TETRACOSACTIDE

Tetracosactidum

H-Ser-Tyr-Ser-Met-Glu-His-Phe-Arg-Trp-Gly-
Lys-Pro-Val-Gly-Lys-Lys-Arg-Arg-Pro-Val-
Lys-Val-Tyr-Pro-OH

C₁₃₆H₂₁₀N₄₀O₃₁S

M_r 2933

DEFINITION

Tetracosactide is a synthetic tetracosapeptide in which the sequence of amino acids is the same as that of the first twenty-four residues of human corticotropin. It is available as an acetate and contains water. It increases the rate at which corticoid hormones are secreted by the adrenal glands. The potency is not less than 800 International Units per milligram, calculated with reference to the anhydrous, acetic acid-free substance.

CHARACTERS

A white or yellow, amorphous powder, sparingly soluble in water.

IDENTIFICATION

- It increases the amount of corticosterone produced by isolated rat adrenal cells in the conditions of the assay.
- Examine by electrophoresis (2.2.31) and thin-layer chromatography (2.2.27) to obtain a two-dimensional separation using two plates with *cellulose for chromatography R1* as the coating substance.
Test solution. Dissolve 1 mg of the substance to be examined in 0.2 ml of a 15.4 g/l solution of *ammonium acetate R* adjusted to pH 8.2 with *dilute ammonia R2*. Add 10 µl of a 2 g/l solution of *trypsin R*, maintain the mixture at 37 °C to 38 °C for 40 min, heat on a water-bath

for 3 min and add 5 µl of *glacial acetic acid R*. Evaporate to dryness at 40 °C at a pressure not exceeding 3 kPa, dry the glassy residue at 40 °C for 1 h and dissolve in 0.1 ml of *glacial acetic acid R*. Dry the solution from the frozen state, dissolve the residue in 0.1 ml of *water R* and dry again from the frozen state. Dry the final residue at 45 °C for 1 h at a pressure not exceeding 3 kPa and dissolve in 50 µl of *water R*.

Reference solution. Prepare at the same time and in the same manner as the test solution, using *tetracosactide CRS* instead of the substance to be examined.

Spray the plates with the electrolyte solution which consists of a solution containing 0.2 per cent V/V of *glacial acetic acid R* and 0.2 per cent V/V of *pyridine R*. Place the filter paper tongues to connect the plates with the appropriate compartment of each trough so that each tongue covers an area 1.5 cm wide at one end of the plate. Close the tank and allow to stand for 30 min. Apply the solutions on the anodic side. Apply to the first plate, at a point about 2.5 cm from each of two adjacent edges, 4 µl of the test solution. Apply to the second plate, at a similar position, 4 µl of the reference solution. Apply to both plates a potential of 280 V for a plate 200 mm long and allow electrophoresis to proceed for 90 min. Allow the plates to dry in air for 30 min and then dry in a current of air at 30 °C for 30 min. Carry out a second separation on each plate by thin-layer chromatography. Develop at right angles to the direction of electrophoresis over a path of 15 cm using a mixture of 8 volumes of *glacial acetic acid R*, 24 volumes of *pyridine R*, 30 volumes of *water R* and 38 volumes of *butanol R*. Dry the plates in a current of air and spray with *ninhydrin solution R1*. The principal spots in the chromatogram obtained with the test solution are similar in position to those in the chromatogram obtained with the reference solution, but their intensity may differ.

TESTS

Specific optical rotation (2.2.7). Dissolve 10.0 mg in 1.0 ml of a mixture of 1 volume of *glacial acetic acid R* and 99 volumes of *water R*. The specific optical rotation is -99 to -109, calculated with reference to the anhydrous, acetic acid-free substance.

Absorbance (2.2.25). Dissolve 1.0 mg in 0.1 M *hydrochloric acid* and dilute to 5.0 ml with the same acid. Examined between 240 nm and 280 nm, the solution shows an absorption maximum at 276 nm. The absorbance at the maximum is 0.51 to 0.61, calculated with reference to the anhydrous, acetic acid-free substance. The ratio of the absorbance at the maximum at 276 nm to the absorbance at 248 nm is 2.4 to 2.9.

Amino acids. Examine by means of an amino-acid analyser. Standardise the apparatus with a mixture containing equimolar amounts of ammonia, glycine and the L-form of the following amino acids:

Lysine	Threonine	Alanine	Leucine
Histidine	Serine	Valine	Tyrosine
Arginine	Glutamic acid	Methionine	Phenylalanine
Aspartic acid	Proline	Isoleucine	

together with half the equimolar amount of L-cystine. For the validation of the method, an appropriate internal standard, such as *DL-norleucine R*, is used.

Test solution. Place 1.0 mg of the substance to be examined in a rigorously cleaned hard-glass tube, 100 mm long and 6 mm in internal diameter. Add a suitable amount of a

50 per cent V/V solution of *hydrochloric acid R*. Immerse the tube in a freezing mixture at -5°C , reduce the pressure to below 133 Pa and seal. Heat at 110°C to 115°C for 16 h. Cool, open the tube, transfer the contents to a 10 ml flask with the aid of five quantities, each of 0.2 ml, of *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure. Take up the residue in *water R* and evaporate to dryness over *potassium hydroxide R* under reduced pressure; repeat these operations once. Take up the residue in a buffer solution suitable for the amino-acid analyser used and dilute to a suitable volume with the same buffer solution. Apply a suitable volume to the amino-acid analyser.

Express the content of each amino acid in moles. Calculate the relative proportions of the amino acids, taking that for valine to be equivalent to three. The values fall within the following limits: lysine 3.5 to 4.7; histidine 0.9 to 1.1; arginine 2.7 to 3.3; serine 1.1 to 2.2; glutamic acid 0.9 to 1.1; proline 2.5 to 3.5; glycine 1.8 to 2.2; methionine 0.9 to 1.1; tyrosine 1.7 to 2.2; phenylalanine 0.9 to 1.1. Not more than traces of other amino acids are present, with the exception of tryptophan.

Related peptides

A. Examine by liquid chromatography (2.2.29). Use degassed solvents.

Test solution. Dissolve 1.0 mg of the substance to be examined in 1 ml of *water R*.

Reference solution (a). Dissolve 1.0 mg of the substance to be examined in 1 ml of a 1 per cent V/V solution of *glacial acetic acid R* and add 50 μl of a mixture of 1 volume of *strong hydrogen peroxide solution R* and 999 volumes of *water R*. Allow to stand for 2 h.

Reference solution (b). Dissolve 1.0 mg of *tetracosactide CRS* in 1 ml of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (10 μm),
- as mobile phase at a flow rate of 2.0 ml/min, a mixture of 365 ml of *acetonitrile R*, 10.0 ml of *glacial acetic acid R* and 10.0 g of *ammonium sulphate R*, diluted to 2000 ml with *water R*,
- as detector a spectrophotometer set at 280 nm.

Inject 20 μl of each solution ensuring that the syringe used to inject the test solution is not contaminated with peroxide. The chromatogram obtained with reference solution (a) shows a peak due to tetracosactide corresponding to the principal peak in the chromatogram obtained with the test solution and a peak with a lower retention time, due to tetracosactide sulfoxide, of significantly greater area than any corresponding peak in the chromatogram obtained with the test solution. The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to tetracosactide and tetracosactide sulfoxide is at least 7. In the chromatogram obtained with the test solution, the area of the peak corresponding to tetracosactide sulfoxide is not greater than 4 per cent of the sum of the areas of all the peaks, disregarding any peaks due to the solvent and the mobile phase.

B. Examine by thin-layer chromatography (2.2.27), using *cellulose for chromatography R* as the coating substance.

Test solution. Dissolve 3.0 mg of the substance to be examined in 1.5 ml of a mixture of equal volumes of *dilute acetic acid R* and *water R*.

Reference solution (a). Dilute 0.5 ml of the test solution to 10 ml with a mixture of equal volumes of *dilute acetic acid R* and *water R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with a mixture of equal volumes of *dilute acetic acid R* and *water R*.

Reference solution (c). To 0.5 ml of the test solution add 50 μl of a mixture of 1 volume of *strong hydrogen peroxide solution R* and 999 volumes of *water R*. Allow to stand for 2 h.

Apply to the plate as 1 cm bands 10 μl of each solution. Develop over a path of 15 cm using a mixture of 4 volumes of *glacial acetic acid R*, 24 volumes of *pyridine R*, 30 volumes of *water R* and 42 volumes of *butanol R*. Dry the plate in a current of air and spray with *ninhydrin solution R1*. In the chromatogram obtained with reference solution (c), the band corresponding in position to the principal band in the chromatogram obtained with the test solution is reduced in intensity, and a prominent band, due to tetracosactide sulfoxide, of lower R_f is present. In the chromatogram obtained with the test solution, any band, apart from the principal band and any band due to tetracosactide sulfoxide, is not more intense than the band in the chromatogram obtained with reference solution (a) (5.0 per cent) and at most one such band is more intense than the band in the chromatogram obtained with reference solution (b) (2.5 per cent).

Peptide. Not less than 85.0 per cent of peptide, expressed as $\text{C}_{136}\text{H}_{210}\text{N}_{40}\text{O}_{31}\text{S}$, calculated with reference to the anhydrous, acetic acid-free substance.

Examine the chromatograms obtained in test A for related peptides. Calculate the content of $\text{C}_{136}\text{H}_{210}\text{N}_{40}\text{O}_{31}\text{S}$ from the peak heights or areas in the chromatograms obtained with the test solution and reference solution (b), and the declared content of $\text{C}_{136}\text{H}_{210}\text{N}_{40}\text{O}_{31}\text{S}$ in *tetracosactide CRS*.

Acetic acid (2.5.34): 8.0 per cent to 13.0 per cent.

Test solution. Dissolve 10.0 mg of the substance to be examined in a mixture of 5 volumes of mobile phase B and 95 volumes of mobile phase A and dilute to 10.0 ml with the same mixture of solvents.

Water (2.5.12): 5.0 per cent to 16.0 per cent, determined on 80.0 mg by the semi-micro determination of water.

ASSAY

The potency of tetracosactide is estimated by comparing in given conditions its activity in increasing the amount of corticosterone produced by isolated rat adrenal cells with that of the International Reference Preparation of tetracosactide or a reference preparation calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Reference Preparation which consists of a quantity of synthetic tetracosactide with mannitol. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

Use siliconised glassware and rinse well with *water R* before use. Kill four male rats, each weighing between 200 g and 400 g, by exsanguination. Remove the adrenal glands, carefully free them of adhering fat and immerse in solution B maintained at 4°C . Cut each gland into four equal pieces and transfer to a suitable plastic stirring apparatus (see

Figure 0644.-1) containing 5 ml of solution C maintained at 37 °C. Disperse the adrenal cells by stirring the mixture at 500 r/min. After 20 min, remove the supernatant liquid, cool to 4 °C, add 5 ml of solution C and repeat the dispersal procedure. Repeat the operation a further three times. Combine the five supernatant liquids, centrifuge at 4 °C in a polyethylene test-tube for 30 min after slow acceleration to 100 *g*. Suspend the resulting pellet in 8 ml of solution D and centrifuge for 30 min at 100 *g*. Again suspend the residue in 8 ml of solution D and filter the mixture through nylon gauze with 100 µm pores into a polyethylene beaker and add a suitable volume of solution D to the filtrate (a total volume of 65 ml to 105 ml has been found suitable). Maintain the resulting suspension at 4 °C.

A - pulley and stirring paddle,

B - bearing,

C - incubation medium.

Figure 0644.-1. – *Stirring Apparatus*
Dimensions in millimetres

Prepare four independent dilutions, with two-fold dose intervals, from solutions of suitable concentrations of the substance to be examined and of the reference preparation using solution E as diluent. Pipette 0.1 ml of each dilution into each of four polystyrene test-tubes and add 1.0 ml of the cell suspension prepared above to each tube. Incubate at 37 °C for 2 h and then cool to 4 °C. Transfer 1 ml of the contents of each tube to a glass tube containing 1.4 ml of *methylene chloride R*, mix in a vortex mixer for 10 s and centrifuge at 3000 *g* for 5 min. Transfer 1 ml of each of the methylene chloride layers, avoiding taking up aqueous phase, to a glass tube containing 0.6 ml of a mixture of 15 volumes of *alcohol R* and 35 volumes of *sulphuric acid R*. Mix in a vortex mixer for 10 s and centrifuge at 1500 *g* for 5 min. Allow each tube to stand for 30 min. Examine by fluorimetry (2.2.21), irradiating the lower layer with an excitant beam of suitable wavelength such as 436 nm or 470 nm and measuring the fluorescence at the maximum between 530 nm and 545 nm. If the solutions are not transferred to spectrophotometric measurement cells, select glass tubes that give fluorescence values for a standard

corticosterone which do not differ from each other by more than 5 per cent. Calculate the result of the assay by the usual statistical methods using the linear portion of the log dose-response curve.

Solution A

<i>Sodium chloride R</i>	6.60 g
<i>Potassium chloride R</i>	0.353 g
<i>Sodium hydrogen carbonate R</i>	0.840 g
<i>Potassium dihydrogen phosphate R</i>	0.161 g
<i>Magnesium sulphate R</i>	0.291 g
<i>Calcium chloride R</i>	0.373 g
<i>2-[4-(2-Hydroxyethyl)piperazin-1-yl]ethane sulphonic acid R</i>	4.77 g

Dissolve the above ingredients in about 950 ml of *water R*, adjust to pH 7.4 with 1 *M sodium hydroxide* and add 60 mg of *benzylpenicillin sodium R* and a quantity of *streptomycin sulphate R* equivalent to 100 mg of streptomycin. Dilute to 1000 ml with *water R*.

Solution B

Add 2 g/l of *glucose R* to solution A.

Solution C

To solution B add 1 g/l of a preparation of collagenase obtained from *Clostridium histolyticum* and of a grade suitable for the preparation of dispersed cells.

Solution D

Add 5 g/l of *bovine albumin R* to solution B.

Solution E

A 9 g/l sterile solution of *sodium chloride R* containing 1 g/l of *bovine albumin R* and adjusted to pH 2.0 with 1 *M hydrochloric acid*.

STORAGE

Store under nitrogen, protected from light, at a temperature between 2 °C and 8 °C.

LABELLING

The label states:

- the potency in International Units per milligram,
- the peptide content per container,
- the storage conditions.

01/2005:0211

TETRACYCLINE

Tetracyclinum

$C_{22}H_{24}N_2O_8$

M_r 444.4

DEFINITION

(4*S*,4*aS*,5*aS*,6*S*,12*aS*)-4-(Dimethylamino)-3,6,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide.

Content: 88.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: very slightly soluble in water, soluble in alcohol and in methanol, sparingly soluble in acetone. It dissolves in dilute acid and alkaline solutions.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *tetracycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *tetracycline hydrochloride CRS*, 5 mg of *demeclocycline hydrochloride R* and 5 mg of *oxytetracycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: TLC octadecylsilyl silica gel F_{254} plate *R*.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid R*. A violet-red colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.C. Dissolve about 10 mg in a mixture of 1 ml of *dilute nitric acid R* and 5 ml of *water R*. Shake and add 1 ml of *silver nitrate solution R2*. Any opalescence in the solution is not more intense than that in a mixture of 1 ml of *dilute nitric acid R*, 5 ml of *water R* and 1 ml of *silver nitrate solution R2*.

TESTS

pH (2.2.3): 3.5 to 6.0.

Suspend 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): –260 to –280 (dried substance).

Dissolve 0.250 g in 0.1 M *hydrochloric acid* and dilute to 50.0 ml with the same acid.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 25.0 mg of *tetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 12.5 mg of *4-epitetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (c). Dissolve 10.0 mg of *anhydrotetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 100.0 ml with the same acid.

Reference solution (d). Dissolve 10.0 mg of *4-epianhydrotetracycline hydrochloride CRS* in 0.01 M *hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (e). Mix 1.0 ml of reference solution (a), 2.0 ml of reference solution (b) and 5.0 ml of reference solution (d) and dilute to 25.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (f). Mix 40.0 ml of reference solution (b), 20.0 ml of reference solution (c) and 5.0 ml of reference solution (d) and dilute to 200.0 ml with 0.01 M *hydrochloric acid*.

Reference solution (g). Dilute 1.0 ml of reference solution (c) to 50.0 ml with 0.01 M *hydrochloric acid*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (8 µm),
- temperature: 60 °C.

Mobile phase: weigh 80.0 g of *2-methyl-2-propanol R* and transfer to a 1000 ml volumetric flask with the aid of 200 ml of *water R*; add 100 ml of a 35 g/l solution of *dipotassium hydrogen phosphate R* adjusted to pH 9.0 with *dilute phosphoric acid R*, 200 ml of a 10 g/l solution of *tetrabutylammonium hydrogen sulphate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R* and 10 ml of a 40 g/l solution of *sodium edetate R* adjusted to pH 9.0 with *dilute sodium hydroxide solution R*; dilute to 1000.0 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 µl; inject the test solution and reference solutions (e), (f) and (g).

System suitability:

- resolution: minimum 2.5 between the peaks due to impurity A (1st peak) and tetracycline (2nd peak) and minimum 8.0 between the peaks due to tetracycline and impurity D (3rd peak) in the chromatogram obtained with reference solution (e); if necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase,
- signal-to-noise ratio: minimum 3 for the principal peak in the chromatogram obtained with reference solution (g),
- symmetry factor: maximum 1.25 for the peak due to tetracycline in the chromatogram obtained with reference solution (e).

Limits:

- impurity A: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (5.0 per cent),
- impurity B (eluting on the tail of the principal peak): not more than 0.4 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (2.0 per cent),
- impurity C: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (1.0 per cent),
- impurity D: not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test C. Prepare the standard using 2.5 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 13.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{24}N_2O_8$.

STORAGE

Protected from light.

IMPURITIES

A. $R_1 = NH_2$, $R_2 = H$, $R_3 = N(CH_3)_2$: (4*R*,4*aS*,5*aS*,6*S*,12*aS*)-4-(dimethylamino)-3,6,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide (4-epitetracycline),

B. $R_1 = CH_3$, $R_2 = N(CH_3)_2$, $R_3 = H$: (4*S*,4*aS*,5*aS*,6*S*,12*aS*)-2-acetyl-4-(dimethylamino)-3,6,10,12,12*a*-pentahydroxy-6-methyl-4*a*,5*a*,6,12*a*-tetrahydrotetracene-1,11(4*H*,5*H*)-dione (2-acetyl-2-decarbamoylepianhydrotetracycline),

C. $R_1 = N(CH_3)_2$, $R_2 = H$: (4*S*,4*aS*,12*aS*)-4-(dimethylamino)-3,10,11,12*a*-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4*a*,5,12,12*a*-hexahydrotetracene-2-carboxamide (anhydrotetracycline),

D. $R_1 = H$, $R_2 = N(CH_3)_2$: (4*R*,4*aS*,12*aS*)-4-(dimethylamino)-3,10,11,12*a*-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4*a*,5,12,12*a*-hexahydrotetracene-2-carboxamide (4-epianhydrotetracycline).

CHARACTERS

Appearance: yellow, crystalline powder.

Solubility: soluble in water, slightly soluble in alcohol, practically insoluble in acetone. It dissolves in solutions of alkali hydroxides and carbonates. Solutions in water become turbid on standing, owing to the precipitation of tetracycline.

IDENTIFICATION

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 5 mg of *tetracycline hydrochloride CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of *tetracycline hydrochloride CRS*, 5 mg of *demeclocycline hydrochloride R* and 5 mg of *oxytetracycline hydrochloride R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC octadecylsilyl silica gel F₂₅₄ plate R*.

Mobile phase: mix 20 volumes of *acetonitrile R*, 20 volumes of *methanol R* and 60 volumes of a 63 g/l solution of *oxalic acid R* previously adjusted to pH 2 with *concentrated ammonia R*.

Application: 1 µl.

Development: over 3/4 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 3 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

B. To about 2 mg add 5 ml of *sulphuric acid R*. A violet-red colour develops. Add the solution to 2.5 ml of *water R*. The colour becomes yellow.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 1.8 to 2.8.

Dissolve 0.1 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): –240 to –255 (dried substance).

Dissolve 0.250 g in 0.1 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (a). Dissolve 25.0 mg of *tetracycline hydrochloride CRS* in 0.01 *M hydrochloric acid* and dilute to 25.0 ml with the same acid.

Reference solution (b). Dissolve 15.0 mg of 4-epitetracycline hydrochloride CRS in 0.01 *M hydrochloric acid* and dilute to 50.0 ml with the same acid.

Reference solution (c). Dissolve 10.0 mg of anhydrotetracycline hydrochloride CRS in 0.01 *M hydrochloric acid* and dilute to 100.0 ml with the same acid.

Reference solution (d). Dissolve 10.0 mg of 4-epianhydrotetracycline hydrochloride CRS in 0.01 *M hydrochloric acid* and dilute to 50.0 ml with the same acid.

01/2005:0210

TETRACYCLINE HYDROCHLORIDE

Tetracyclini hydrochloridum

$C_{22}H_{25}ClN_2O_8$

M_r 480.9

DEFINITION

(4*S*,4*aS*,5*aS*,6*S*,12*aS*)-4-(Dimethylamino)-3,6,10,12,12*a*-pentahydroxy-6-methyl-1,11-dioxo-1,4,4*a*,5,5*a*,6,11,12*a*-octahydrotetracene-2-carboxamide hydrochloride.

Content: 95.0 per cent to 102.0 per cent (dried substance).

Reference solution (e). Mix 1.0 ml of reference solution (a), 2.0 ml of reference solution (b) and 5.0 ml of reference solution (d) and dilute to 25.0 ml with 0.01 M hydrochloric acid.

Reference solution (f). Mix 20.0 ml of reference solution (b), 10.0 ml of reference solution (c) and 5.0 ml of reference solution (d) and dilute to 200.0 ml using 0.01 M hydrochloric acid.

Reference solution (g). Dilute 1.0 ml of reference solution (c) to 50.0 ml with 0.01 M hydrochloric acid.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** styrene-divinylbenzene copolymer R (8 μ m),
- **temperature:** 60 °C.

Mobile phase: weigh 80.0 g of 2-methyl-2-propanol R and transfer to a 1000 ml volumetric flask with the aid of 200 ml of water R; add 100 ml of a 35 g/l solution of dipotassium hydrogen phosphate R adjusted to pH 9.0 with dilute phosphoric acid R, 200 ml of a 10 g/l solution of tetrabutylammonium hydrogen sulphate R adjusted to pH 9.0 with dilute sodium hydroxide solution R and 10 ml of a 40 g/l solution of sodium edetate R adjusted to pH 9.0 with dilute sodium hydroxide solution R; dilute to 1000.0 ml with water R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject the test solution and reference solutions (e), (f) and (g).

System suitability:

- **resolution:** minimum 2.5 between the peaks due to impurity A (1st peak) and tetracycline (2nd peak) and minimum 8.0 between the peaks due to tetracycline and impurity D (3rd peak) in the chromatogram obtained with reference solution (e); if necessary, adjust the concentration of 2-methyl-2-propanol in the mobile phase,
- **signal-to-noise ratio:** minimum 3 for the principal peak in the chromatogram obtained with reference solution (g),
- **symmetry factor:** maximum 1.25 for the peak due to tetracycline in the chromatogram obtained with reference solution (e).

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (3.0 per cent),
- **impurity B** (eluting on the tail of the principal peak): not more than half the area of the peak due to impurity A in the chromatogram obtained with reference solution (f) (1.5 per cent),
- **impurity C:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent),
- **impurity D:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (f) (0.5 per cent).

Heavy metals (2.4.8): maximum 50 ppm.

0.5 g complies with limit test C. Prepare the standard using 2.5 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32): maximum 2.0 per cent, determined on 1.000 g by drying at 60 °C over diphosphorus pentoxide R at a pressure not exceeding 670 Pa for 3 h.

Sulphated ash (2.4.14): maximum 0.5 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 0.5 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{22}H_{25}ClN_2O_8$.

STORAGE

Protected from light. If the substance is sterile, store in a sterile, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. R1 = NH₂, R2 = H, R3 = N(CH₃)₂: (4R,4aS,5aS,6S,12aS)-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-1,11-dioxo-1,4,4a,5,5a,6,11,12a-octahydrotetracene-2-carboxamide (4-epitetracycline),

B. R1 = CH₃, R2 = N(CH₃)₂, R3 = H: (4S,4aS,5aS,6S,12aS)-2-acetyl-4-(dimethylamino)-3,6,10,12,12a-pentahydroxy-6-methyl-4a,5a,6,12a-tetrahydrotetracene-1,11(4H,5H)-dione (2-acetyl-2-decarbamoyletetracycline),

C. R1 = N(CH₃)₂, R2 = H: (4S,4aS,12aS)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (anhydrotetracycline),

D. R1 = H, R2 = N(CH₃)₂: (4R,4aS,12aS)-4-(dimethylamino)-3,10,11,12a-tetrahydroxy-6-methyl-1,12-dioxo-1,4,4a,5,12,12a-hexahydrotetracene-2-carboxamide (4-epianhydrotetracycline).

01/2005:1738

TETRAZEPAM

Tetrazepamum

$C_{16}H_{17}ClN_2O$

M_r 288.8

DEFINITION

7-Chloro-5-(cyclohex-1-enyl)-1-methyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: light yellow or yellow crystalline powder.

Solubility: practically insoluble in water, freely soluble in methylene chloride, soluble in acetonitrile.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of tetrazepam.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in *acetonitrile R* and dilute to 25.0 ml with the same solvent.

Reference solution (a). Dissolve 5.0 mg of the substance to be examined and 5.0 mg of *tetrazepam impurity C CRS* in *acetonitrile R* and dilute to 10.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *acetonitrile R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with *acetonitrile R*. Dilute 1.0 ml of this solution to 10.0 ml with *acetonitrile R*.

Column:

- *size*: $l = 0.25$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: octadecylsilyl silica gel for chromatography *R* (5 μ m).

Mobile phase:

- *mobile phase A*: mix 40 volumes of *acetonitrile R* and 60 volumes of a 3.4 g/l solution of *potassium dihydrogen phosphate R*,
- *mobile phase B*: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 35	100	0
35 - 40	100 → 55	0 → 45
40 - 50	55	45
50 - 60	55 → 100	45 → 0

Flow rate: 1.5 ml/min.

Detection: a spectrophotometer at 229 nm.

Injection: 20 μ l.

System suitability: reference solution (a):

- *resolution*: minimum 2.0 between the peaks due to tetrazepam and to impurity C.

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Chlorides (2.4.4): maximum 100 ppm.

Dissolve 0.750 g in 10 ml of *methylene chloride R* and add 15 ml of *water R*. Shake and separate the 2 layers. Dilute 10 ml of the aqueous layer to 15 ml with *water R*. The solution obtained complies with the limit test for chlorides.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.230 g in 50.0 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 28.88 mg of $C_{16}H_{17}ClN_2O$.

STORAGE

Protected from light.

IMPURITIES

A. 7-chloro-5-(3-oxocyclohex-1-enyl)-1-methyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

B. R = R' = H: 7-chloro-5-cyclohexyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

C. R = CH₃, R' = H: 7-chloro-5-cyclohexyl-1-methyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

D. R = CH₃, R' = Cl: 7-chloro-5-(1-chlorocyclohexyl)-1-methyl-1,3-dihydro-2H-1,4-benzodiazepin-2-one,

E. 5-(cyclohex-1-enyl)-1,3-dihydro-2H-1,4-benzodiazepin-2-one.

THEOBROMINE

Theobrominum

C₇H₈N₄O₂*M_r* 180.2

DEFINITION

Theobromine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3,7-dimethyl-3,7-dihydro-1*H*-purine-2,6-dione, calculated with reference to the dried substance.

CHARACTERS

A white powder, very slightly soluble in water and in ethanol, slightly soluble in ammonia. It dissolves in dilute solutions of alkali hydroxides and in mineral acids.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *theobromine CRS*.
- B. Dissolve about 20 mg in 2 ml of *dilute ammonia R1*, warming slightly, and cool. Add 2 ml of *silver nitrate solution R2*. The solution remains clear. Boil the solution for a few minutes. A white, crystalline precipitate is formed.
- C. It gives the reaction of xanthines (2.3.1).

TESTS

Acidity. To 0.4 g add 20 ml of boiling *water R* and boil for 1 min. Allow to cool and filter. Add 0.05 ml of *bromothymol blue solution R1*. The solution is yellow or yellowish-green. Not more than 0.2 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to blue.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. To 0.2 g of the finely powdered substance to be examined add 10 ml of a mixture of 4 volumes of *methanol R* and 6 volumes of *chloroform R*. Heat under a reflux condenser on a water-bath for 15 min, shaking occasionally. Cool and filter.

Reference solution. Dissolve 5 mg of *theobromine CRS* in a mixture of 4 volumes of *methanol R* and 6 volumes of *chloroform R* and dilute to 50 ml with the same mixture of solvents.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *chloroform R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

01/2005:0298 Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 125 ml of boiling *water R*, cool to 50 °C to 60 °C and add 25 ml of 0.1 *M silver nitrate*. Using 1 ml of *phenolphthalein solution R* as indicator, titrate with 0.1 *M sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 *M sodium hydroxide* is equivalent to 18.02 mg of C₇H₈N₄O₂.

01/2005:0299

THEOPHYLLINE

Theophyllinum

C₇H₈N₄O₂*M_r* 180.2

DEFINITION

1,3-Dimethyl-3,7-dihydro-1*H*-purine-2,6-dione.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in ethanol. It dissolves in solutions of alkali hydroxides, in ammonia and in mineral acids.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

- A. Melting point (2.2.14): 270 °C to 274 °C, determined after drying at 100-105 °C.
- B. Infrared absorption spectrophotometry (2.2.24).
Comparison: *Ph. Eur. reference spectrum of theophylline*.
- C. Heat 10 mg with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.
- D. It complies with the test for loss on drying (see Tests).
- E. It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 0.5 g with heating in *carbon dioxide-free water R*, cool and dilute to 75 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 50 ml of solution S add 0.1 ml of *methyl red solution R*. The solution is red. Not more than 1.0 ml of 0.01 *M sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *theobromine R* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 5 ml of this solution to 50 ml with the mobile phase.

Column:

- *size:* $l = 0.25$ m, $\varnothing = 4$ mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography *R* (7 μ m).

Mobile phase: mix 7 volumes of acetonitrile for chromatography *R* and 93 volumes of a 1.36 g/l solution of sodium acetate *R* containing 5.0 ml/l of glacial acetic acid *R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 272 nm.

Injection: 20 μ l.

Run time: 3.5 times the retention time of theophylline.

Relative retention with reference to theophylline (retention time = about 6 min): impurity C = about 0.3; impurity B = about 0.4; impurity D = about 0.5; impurity A = about 2.5.

System suitability: reference solution (b):

- *resolution:* minimum 2.0 between the peaks due to theobromine and theophylline.

Limits:

- *impurities A, B, C, D:* for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *any other impurity:* for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total:* not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- *disregard limit:* 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 100 ml of water *R*, add 20 ml of 0.1 M silver nitrate and shake. Add 1 ml of bromothymol blue solution *R1*. Titrate with 0.1 M sodium hydroxide.

1 ml of 0.1 M sodium hydroxide is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E, F.

A. caffeine,

B. 3-methyl-3,7-dihydro-1H-purine-2,6-dione,

C. N-(6-amino-1,3-dimethyl-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-yl)formamide,

D. N-methyl-5-(methylamino)-1H-imidazole-4-carboxamide,

E. 1,3-dimethyl-7,9-dihydro-1H-purine-2,6,8(3H)-trione,

F. etofylline.

01/2005:0302

THEOPHYLLINE MONOHYDRATE

Theophyllinum monohydricum

$C_7H_8N_4O_2 \cdot H_2O$

M_r 198.2

DEFINITION

1,3-Dimethyl-3,7-dihydro-1H-purine-2,6-dione monohydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in ethanol. It dissolves in solutions of alkali hydroxides, in ammonia and in mineral acids.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D, E.

A. Melting point (2.2.14): 270 °C to 274 °C, determined after drying at 100–105 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: dry the substance to be examined at 100-105 °C before use.

Comparison: *Ph. Eur. reference spectrum of theophylline.*

C. Heat 10 mg with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.

D. It complies with the test for water (see Tests).

E. It gives the reaction of xanthines (2.3.1).

TESTS

Solution S. Dissolve 0.5 g with heating in *carbon dioxide-free water R*, cool and dilute to 75 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity. To 50 ml of solution S add 0.1 ml of *methyl red solution R*. The solution is red. Not more than 1.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 10 mg of *theobromine R* in the mobile phase, add 5 ml of the test solution and dilute to 100 ml with the mobile phase. Dilute 5 ml of this solution to 50 ml with the mobile phase.

Column:

- size: $l = 0.25$ m, $\varnothing = 4$ mm,
- stationary phase: *octadecylsilyl silica gel for chromatography R* (7 μ m).

Mobile phase: mix 7 volumes of *acetonitrile for chromatography R* and 93 volumes of a 1.36 g/l solution of *sodium acetate R* containing 5.0 ml/l of *glacial acetic acid R*.

Flow rate: 2.0 ml/min.

Detection: spectrophotometer at 272 nm.

Injection: 20 μ l.

Run time: 3.5 times the retention time of theophylline.

Relative retention with reference to theophylline (retention time = about 6 min): impurity C = about 0.3; impurity B = about 0.4; impurity D = about 0.5; impurity A = about 2.5.

System suitability: reference solution (b):

- resolution: minimum 2.0 between the peaks due to theobromine and theophylline.

Limits:

- impurities A, B, C, D: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- any other impurity: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),

- total: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- disregard limit: 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): 8.0 per cent to 9.5 per cent, determined on 0.20 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.160 g in 100 ml of *water R*, add 20 ml of 0.1 M *silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with 0.1 M *sodium hydroxide*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

IMPURITIES

Specified impurities: A, B, C, D.

Other detectable impurities: E, F.

A. caffeine,

B. 3-methyl-3,7-dihydro-1H-purine-2,6-dione,

C. *N*-(6-amino-1,3-dimethyl-2,4-dioxo-1,2,3,4-tetrahydropyrimidin-5-yl)formamide,

D. *N*-methyl-5-(methylamino)-1H-imidazole-4-carboxamide,

E. 1,3-dimethyl-7,9-dihydro-1H-purine-2,6,8(3H)-trione,

F. etofylline.

01/2005:0300

THEOPHYLLINE-ETHYLENEDIAMINE

Theophyllinum et ethylenediaminum

 $C_{16}H_{24}N_{10}O_4$ M_r 420.4

DEFINITION

Theophylline-ethylenediamine contains not less than 84.0 per cent and not more than the equivalent of 87.4 per cent of theophylline ($C_7H_8N_4O_2$; M_r 180.2) and not less than 13.5 per cent and not more than the equivalent of 15.0 per cent of ethylenediamine ($C_2H_8N_2$; M_r 60.1), both calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellowish powder, sometimes granular, freely soluble in water (the solution becomes cloudy through absorption of carbon dioxide), practically insoluble in ethanol.

IDENTIFICATION

First identification: B, C, E.

Second identification: A, C, D, E, F.

Dissolve 1.0 g in 10 ml of *water R* and add 2 ml of *dilute hydrochloric acid R* dropwise with shaking. Filter. Use the precipitate for identification tests A, B, D and F and the filtrate for identification test C.

- The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 270 °C to 274 °C.
- Examine the precipitate, washed with *water R* and dried at 100 °C to 105 °C, by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *theophylline CRS*.
- To the filtrate add 0.2 ml of *benzoyl chloride R*, make alkaline with *dilute sodium hydroxide solution R* and shake vigorously. Filter the precipitate, wash with 10 ml of *water R*, dissolve in 5 ml of hot *alcohol R* and add 5 ml of *water R*. A precipitate is formed, which when washed and dried at 100 °C to 105 °C, melts (2.2.14) at 248 °C to 252 °C.
- Heat about 10 mg of the precipitate with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.
- It complies with the test for water (see Tests).
- The precipitate gives the reaction of xanthines (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g with gentle warming in 10 ml of *carbon dioxide-free water R*. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.2 g of the substance to be examined in 2 ml of *water R* with heating and dilute to 10 ml with *methanol R*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *chloroform R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 1.5 per cent, determined on 2.00 g dissolved in 20 ml of *anhydrous pyridine R*, by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Ethylenediamine. Dissolve 0.250 g in 30 ml of *water R*. Add 0.1 ml of *bromocresol green solution R*. Titrate with 0.1 M *hydrochloric acid* until a green colour is obtained.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 3.005 mg of $C_2H_8N_2$.

Theophylline. Heat 0.200 g to constant mass in an oven at 135 °C. Dissolve the residue with heating in 100 ml of *water R*, allow to cool, add 20 ml of 0.1 M *silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with 0.1 M *sodium hydroxide*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.02 mg of $C_7H_8N_4O_2$.

STORAGE

Store in airtight container, protected from light.

01/2005:0301

THEOPHYLLINE-ETHYLENEDIAMINE
HYDRATETheophyllinum et ethylenediaminum
hydricum

DEFINITION

Theophylline-ethylenediamine hydrate contains not less than 84.0 per cent and not more than the equivalent of 87.4 per cent of theophylline ($C_7H_8N_4O_2$; M_r 180.2) and not less than 13.5 per cent and not more than the equivalent of 15.0 per cent of ethylenediamine ($C_2H_8N_2$; M_r 60.1), both calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellowish powder, sometimes granular, freely soluble in water (the solution becomes cloudy through absorption of carbon dioxide), practically insoluble in ethanol.

IDENTIFICATION

First identification: B, C, E.

Second identification: A, C, D, E, F.

Dissolve 1.0 g in 10 ml of *water R* and add 2 ml of *dilute hydrochloric acid R* dropwise with shaking. Filter. Use the precipitate for identification tests A, B, D and F and the filtrate for identification test C.

- A. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 270 °C to 274 °C.
- B. Examine the precipitate, washed with *water R* and dried at 100 °C to 105 °C, by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *theophylline CRS*.
- C. To the filtrate add 0.2 ml of *benzoyl chloride R*, make alkaline with *dilute sodium hydroxide solution R* and shake vigorously. Filter the precipitate, wash with 10 ml of *water R*, dissolve in 5 ml of hot *alcohol R* and add 5 ml of *water R*. A precipitate is formed, which when washed and dried at 100 °C to 105 °C, melts (2.2.14) at 248 °C to 252 °C.
- D. Heat about 10 mg of the precipitate with 1.0 ml of a 360 g/l solution of *potassium hydroxide R* in a water-bath at 90 °C for 3 min, then add 1.0 ml of *diazotised sulphanilic acid solution R*. A red colour slowly develops. Carry out a blank test.
- E. It contains 3.0 per cent to 8.0 per cent of water (see Tests).
- F. The precipitate gives the reaction of xanthines (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g with gentle warming in 10 ml of *carbon dioxide-free water R*. The solution is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution GY₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.2 g of the substance to be examined in 2 ml of *water R* with heating and dilute to 10 ml with *methanol R*.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *concentrated ammonia R*, 30 volumes of *acetone R*, 30 volumes of *chloroform R* and 40 volumes of *butanol R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) *R*.

Water (2.5.12): 3.0 per cent to 8.0 per cent, determined on 0.50 g dissolved in 20 ml of *pyridine R*, by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Ethylenediamine. Dissolve 0.250 g in 30 ml of *water R*. Add 0.1 ml of *bromocresol green solution R*. Titrate with 0.1 M *hydrochloric acid* until a green colour is obtained.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 3.005 mg of C₂H₈N₂.

Theophylline. Heat 0.200 g to constant mass in an oven at 135 °C. Dissolve the residue with heating in 100 ml of *water R*, allow to cool, add 20 ml of 0.1 M *silver nitrate* and shake. Add 1 ml of *bromothymol blue solution R1*. Titrate with 0.1 M *sodium hydroxide*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 18.02 mg of C₇H₈N₄O₂.

STORAGE

Store in a well-filled airtight container, protected from light.

01/2005:1706

THIAMAZOLE

Thiamazolum

C₄H₆N₂S

*M*_r 114.2

DEFINITION

1-Methyl-1,3-dihydro-2H-imidazole-2-thione.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or pale brown, crystalline powder.

Solubility: freely soluble in water, freely soluble in methylene chloride, freely soluble or soluble in ethanol (96 per cent).

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

- A. Melting point (2.2.14): 143 °C to 146 °C.
- B. Dissolve 25 mg in 10 ml of a 0.28 per cent V/V solution of *sulphuric acid R* and dilute to 50.0 ml with the same solution. Dilute 1.0 ml of this solution to 100.0 ml with a 0.28 per cent V/V solution of *sulphuric acid R*. Examined between 200 nm and 300 nm (2.2.25), the solution shows 2 absorption maxima, at 211 nm and 251 nm. The ratio of the absorbance measured at the absorption maximum at 251 nm to that measured at the absorption maximum at 211 nm is 2.5 to 2.7.
- C. Infrared absorption spectrophotometry (2.2.24).
Preparation: discs.
Comparison: *thiamazole CRS*.
- D. Thin-layer chromatography (2.2.27).
Test solution. Dissolve 5.0 mg of the substance to be examined in *methanol R* and dilute to 5.0 ml with the same solvent.
Reference solution (a). Dissolve 5.0 mg of *thiamazole CRS* in *methanol R* and dilute to 5.0 ml with the same solvent.
Reference solution (b). Dissolve 5.0 mg of *2-methylimidazole R* in *methanol R* and dilute to 5.0 ml with the same solvent. Dilute 1.0 ml of this solution to 2.0 ml with the test solution.
Plate: TLC silica gel F₂₅₄ plate *R*.

Mobile phase: concentrated ammonia R1, 2-propanol R, toluene R (1:24:75 V/V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: reference solution (b):

- expose the plate to iodine vapour for 30 min; the chromatogram shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.0 g in water R and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, Method II).

Related substances. Gas chromatography (2.2.28).

Test solution. Dissolve 0.100 g of the substance to be examined in chloroform R and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with chloroform R. Dilute 1.0 ml of this solution to 10.0 ml with chloroform R.

Reference solution (b). Dissolve 5.0 mg of thiamazole impurity A CRS, 5.0 mg of 1-methylimidazole R1 and 5.0 mg of thiamazole impurity C CRS in chloroform R and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with chloroform R.

Column:

- **material:** fused silica,
- **size:** *l* = 30.0 m, Ø = 0.25 mm,
- **stationary phase:** poly(dimethyl)(diphenyl)siloxane R with special deactivation for basic compounds (film thickness 0.5 µm).

Carrier gas: helium for chromatography R.

Flow rate: 1.5 ml/min.

Split ratio: 3:20.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	100
	2 - 7	100 → 250
	7 - 22	250
Injection port		150
Detector		250

Detection: flame ionisation.

Injection: 1 µl.

Relative retention with reference to thiamazole (retention time = about 6.5 min): impurity A = about 0.3; impurity B = about 0.4; impurity C = about 0.7.

System suitability: reference solution (b):

- **resolution:** minimum 1.5 between the peaks due to impurity A and impurity B.

Limits:

- **impurities A, B, C:** for each impurity, not more than the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.1 per cent),

- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the reference solution using lead standard solution (1 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 75 ml of water R. Add 15.0 ml of 0.1 M sodium hydroxide, mix and add with stirring, about 30 ml of 0.1 M silver nitrate. Continue the titration with 0.1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M sodium hydroxide is equivalent to 11.42 mg of C₄H₆N₂S.

IMPURITIES

Specified impurities: A, B, C.

A. 2,2-dimethoxy-N-methylethanamine,

B. R = H: 1-methyl-1H-imidazole,

C. R = SCH₃: 1-methyl-2-(methylsulphanyl)-1H-imidazole.

01/2005:0303
corrected

THIAMINE HYDROCHLORIDE

Thiaini hydrochloridum

C₁₂H₁₈Cl₂N₄OS

*M*_r 337.3

DEFINITION

3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium chloride hydrochloride.

Content: 98.5 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or colourless crystals.

Solubility: freely soluble in water, soluble in glycerol, slightly soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: thiamine hydrochloride CRS.

B. Dissolve about 20 mg in 10 ml of *water R*, add 1 ml of *dilute acetic acid R* and 1.6 ml of *1 M sodium hydroxide*, heat on a water-bath for 30 min and allow to cool. Add 5 ml of *dilute sodium hydroxide solution R*, 10 ml of *potassium ferricyanide solution R* and 10 ml of *butanol R* and shake vigorously for 2 min. The upper alcoholic layer shows an intense light-blue fluorescence, especially in ultraviolet light at 365 nm. Repeat the test using 0.9 ml of *1 M sodium hydroxide* and 0.2 g of *sodium sulphite R* instead of 1.6 ml of *1 M sodium hydroxide*. Practically no fluorescence is seen.

C. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *distilled water R* and dilute to 25 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ or GY₇ (2.2.2, *Method II*).

Dilute 2.5 ml of solution S to 5 ml with *water R*.

pH (2.2.3): 2.7 to 3.3.

Dilute 2.5 ml of solution S to 10 ml with *water R*.

Related substances. Liquid chromatography (2.2.29).

Solution A. Add 5 volumes of *glacial acetic acid R* to 95 volumes of *water R* and mix.

Test solution. Dissolve 0.35 g of the substance to be examined in 15.0 ml of solution A and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 5 mg of *thiamine impurity E CRS* in 4 ml of solution A and dilute to 25.0 ml with *water R*. Dilute 5.0 ml of the solution to 25.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 50.0 ml with *water R*. Dilute 5.0 ml of this solution to 25.0 ml with *water R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a specific surface area of 350 m²/g and a pore size of 10 nm,
- **temperature:** 45 °C.

Mobile phase:

- **mobile phase A:** 3.764 g/l solution of *sodium hexanesulphonate R* adjusted to pH 3.1 with *phosphoric acid R*,
- **mobile phase B:** *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	90 → 70	10 → 30
25 - 33	70 → 50	30 → 50
33 - 40	50	50
40 - 45	50 → 90	50 → 10

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 248 nm.

Injection: 25 μ l.

Relative retention with reference to thiamine (retention time = about 30 min): impurity A = about 0.3; impurity B = about 0.9; impurity C = about 1.2.

System suitability: reference solution (a):

- **resolution:** minimum 1.6 between the peaks due to impurity E and to thiamine.

Limits:

- **any impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.4 per cent),
- **total:** not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **disregard limit:** 0.125 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Sulphates (2.4.13): maximum 300 ppm.

5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates.

Heavy metals (2.4.8): maximum 20 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Water (2.5.12): maximum 5.0 per cent, determined on 0.40 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.110 g in 5 ml of *anhydrous formic acid R* and add 50 ml of *acetic anhydride R*. Titrate immediately with *0.1 M perchloric acid*, determining the end-point potentiometrically (2.2.20) and carrying out the titration within 2 min. Carry out a blank titration.

1 ml of *0.1 M perchloric acid* is equivalent to 16.86 mg of C₁₂H₁₈Cl₂N₄OS.

STORAGE

In a non-metallic container, protected from light.

IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities: D, E, F, G, H.

- A. R₁ = CH₃, R₂ = O-SO₃⁻: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methyl-5-[2-(sulphonatoxy)ethyl]thiazolium (thiamine sulphate ester),
- B. R₁ = H, R₂ = OH: 3-[(4-aminopyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (desmethylthiamine),
- C. R₁ = CH₃, R₂ = Cl: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-chloroethyl)-4-methylthiazolium (chlorothiamine),
- F. R₁ = C₂H₅, R₂ = OH: 3-[(4-amino-2-ethylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (ethylthiamine),

01/2005:0531

THIAMINE NITRATE

Thiaini nitras

 $C_{12}H_{17}N_5O_4S$
 M_r 327.4

DEFINITION

3-[(4-Amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium nitrate.

Content: 98.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder or small, colourless crystals.

Solubility: sparingly soluble in water, freely soluble in boiling water, slightly soluble in alcohol and in methanol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of thiamine nitrate.

B. Dissolve about 20 mg in 10 ml of *water R*, add 1 ml of *dilute acetic acid R* and 1.6 ml of 1 *M* sodium hydroxide, heat on a water-bath for 30 min and allow to cool. Add 5 ml of *dilute sodium hydroxide solution R*, 10 ml of *potassium ferricyanide solution R* and 10 ml of *butanol R* and shake vigorously for 2 min. The upper alcoholic layer shows an intense light-blue fluorescence, especially in ultraviolet light at 365 nm. Repeat the test using 0.9 ml of 1 *M* sodium hydroxide and 0.2 g of sodium sulphite *R* instead of 1.6 ml of 1 *M* sodium hydroxide. Practically no fluorescence is produced.

C. About 5 mg gives the reaction of nitrates (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

pH (2.2.3): 6.8 to 7.6 for solution S.

Related substances. Liquid chromatography (2.2.29).

Solution A. Add 5 volumes of *glacial acetic acid R* to 95 volumes of *water R* and mix.

Test solution. Dissolve 0.35 g of the substance to be examined in 15.0 ml of solution A and dilute to 100.0 ml with *water R*.

Reference solution (a). Dissolve 5 mg of the substance to be examined and 5 mg of *thiamine impurity E CRS* in 4 ml of solution A and dilute to 25.0 ml with *water R*. Dilute 5.0 ml of the solution to 25.0 ml with *water R*.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with *water R*.

Column:

– *size*: $l = 0.25$ m, $\varnothing = 4.0$ mm,

– *stationary phase*: spherical *end-capped octadecylsilyl silica gel for chromatography R* (4 μ m) with a specific surface area of 350 m²/g and a pore size of 10 nm,

– *temperature*: 45 °C.

Mobile phase:

– *mobile phase A*: 3.764 g/l solution of *sodium hexanesulphonate R* adjusted to pH 3.1 with *phosphoric acid R*,

– *mobile phase B*: *methanol R2*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 25	90 → 70	10 → 30
25 - 33	70 → 50	30 → 50
33 - 40	50	50
40 - 45	50 → 90	50 → 10

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 248 nm.

Injection: 25 μ l.

Relative retention with reference to thiamine (retention time = about 30 min): impurity A = about 0.3; impurity B = about 0.9; impurity C = about 1.2.

System suitability: reference solution (a):

– *resolution*: minimum 1.6 between the peaks due to impurity E and to thiamine.

Limits:

– *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),

– *total*: not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),

– *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

01/2005:0109

ASSAY

Dissolve 0.140 g in 5 ml of *anhydrous formic acid R* and add 50 ml of *acetic anhydride R*. Titrate immediately with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20) and carrying out the titration within 2 min. Carry out a blank titration.

1.0 ml of 0.1 M *perchloric acid* is equivalent to 16.37 mg of $C_{12}H_{17}N_5O_4S$.

STORAGE

In a non-metallic container, protected from light.

IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities: D, E, F, G, H.

A. $R_1 = CH_3$, $R_2 = O-SO_3^-$: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methyl-5-[2-(sulphonatooxy)ethyl]thiazolium (thiamine sulphate ester),

B. $R_1 = H$, $R_2 = OH$: 3-[(4-aminopyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (desmethylthiamine),

C. $R_1 = CH_3$, $R_2 = Cl$: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-chloroethyl)-4-methylthiazolium (chlorothiamine),

F. $R_1 = C_2H_5$, $R_2 = OH$: 3-[(4-amino-2-ethylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazolium (ethylthiamine),

G. $R_1 = CH_3$, $R_2 = O-CO-CH_3$: 5-[2-(acetyloxy)ethyl]-3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-4-methylthiazolium (acetylthiamine),

D. $X = O$: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazol-2(3H)-one (oxothiamine),

E. $X = S$: 3-[(4-amino-2-methylpyrimidin-5-yl)methyl]-5-(2-hydroxyethyl)-4-methylthiazol-2(3H)-thione (thioxothiamine),

and enantiomer

H. (3*RS*)-3-[[[(4-amino-2-methylpyrimidin-5-yl)methyl]thiocarbamoyl]sulphonyl]-4-oxopentyl acetate (ketodithiocarbamate).

THIAMPHENICOL

Thiamphenicolum

 $C_{12}H_{15}Cl_2NO_5S$
 M_r 356.2

DEFINITION

Thiamphenicol contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of 2,2-dichloro-*N*[(1*R*,2*R*)-2-hydroxy-1-(hydroxymethyl)-2-[4-(methylsulphonyl)phenyl]ethyl]acetamide, calculated with reference to the dried substance.

CHARACTERS

A fine, white or yellowish-white, crystalline powder or crystals, slightly soluble in water and in ethyl acetate, very soluble in dimethylacetamide, freely soluble in acetonitrile and in dimethylformamide, soluble in methanol, sparingly soluble in acetone and in ethanol.

A solution in ethanol is dextrorotatory and a solution in dimethylformamide is laevorotatory.

IDENTIFICATION

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *thiamphenicol CRS*. Dry the substances at 100 °C to 105 °C for 2 h and examine in the form of discs prepared using *potassium bromide R*.

B. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.1 g of *thiamphenicol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 3 volumes of *methanol R* and 97 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the spot in the chromatogram obtained with the reference solution.

C. To 50 mg in a porcelain crucible add 0.5 g of *anhydrous sodium carbonate R*. Heat over an open flame for 10 min. Allow to cool. Take up the residue with 5 ml of *dilute nitric acid R* and filter. To 1 ml of the filtrate add 1 ml of *water R*. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

Acidity or alkalinity. Shake 0.1 g with 20 ml of *carbon dioxide-free water R* and add 0.1 ml of *bromothymol blue solution R1*. Not more than 0.1 ml of 0.02 M *hydrochloric acid* or 0.02 M *sodium hydroxide* is required to change the colour of the indicator.

Specific optical rotation (2.2.7). Dissolve 1.25 g in *dimethylformamide R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is -21 to -24 , calculated with reference to the dried substance.

Melting point (2.2.14). $163\text{ }^{\circ}\text{C}$ to $167\text{ }^{\circ}\text{C}$.

Absorbance (2.2.25). Dissolve 20 mg in *water R*, heating to about $40\text{ }^{\circ}\text{C}$, and dilute to 100.0 ml with the same solvent. Examined between 240 nm and 300 nm, the solution shows 2 absorption maxima, at 266 nm and 273 nm. The specific absorbances at these maxima are 25 to 28 and 21.5 to 23.5, respectively. Dilute 2.5 ml of the solution to 50.0 ml with *water R*. Examined between 200 nm and 240 nm, the solution shows an absorption maximum at 224 nm. The specific absorbance at this maximum is 370 to 400.

Chlorides (2.4.4). Shake 0.5 g with 30 ml of *water R* for 5 min and filter. 15 ml of the filtrate complies with the limit test for chlorides (200 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb R)*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at $100\text{ }^{\circ}\text{C}$ to $105\text{ }^{\circ}\text{C}$.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.300 g in 30 ml of *alcohol R*, add 20 ml of a 500 g/l solution of *potassium hydroxide R*, mix and heat under a reflux condenser for 4 h. Cool, add 100 ml of *water R*, neutralise with *dilute nitric acid R* and add 5 ml in excess. Titrate with 0.1 M *silver nitrate*, determining the end-point potentiometrically (2.2.20), using a silver indicator electrode and a mercurous sulphate reference electrode or any other appropriate electrode. Carry out a blank test.

1 ml of 0.1 M *silver nitrate* is equivalent to 17.81 mg of $\text{C}_{12}\text{H}_{15}\text{Cl}_2\text{NO}_5\text{S}$.

STORAGE

Store in an airtight container, protected from light.

01/2005:1625

THIOMERSAL

Thiomersalum

$\text{C}_9\text{H}_9\text{HgNaO}_2\text{S}$

M_r 404.8

DEFINITION

Sodium ethyl[2-sulphanylbenzoato(2-)-O,S]mercurate(1-).
Content: 97.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, sparingly soluble or soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point of the derivative (2.2.14): $103\text{ }^{\circ}\text{C}$ to $108\text{ }^{\circ}\text{C}$.

Dissolve 0.5 g in *water R* and dilute to 10 ml with the same solvent. Add 2 ml of *dilute hydrochloric acid R*. A white precipitate is formed. Wash the precipitate with *water R* and dry over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *thiomersal CRS*.

C. Treat 50 mg by the oxygen-flask method (2.5.10). Use a mixture of 1 ml of *strong hydrogen peroxide solution R* and 50 ml of *water R* to absorb the combustion products. To the solution add 5 ml of *dilute nitric acid R*. 0.1 ml of this solution gives reaction (a) of mercury (2.3.1). To the remaining part of the solution add 10 ml of *dilute hydrochloric acid R* and filter. 5 ml of the filtrate, without further addition of acid, gives reaction (a) of sulphates (2.3.1).

D. Solution S (see Tests) gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

pH (2.2.3): 6.0 to 8.0.

Dilute 5 ml of solution S to 50 ml with *carbon dioxide-free water R*.

Inorganic mercury compounds: maximum 0.70 per cent.

Protect the solutions from light throughout the procedure.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Reference solution. Dissolve 95.0 mg of *mercuric chloride R* in *water R* and dilute to 50.0 ml with the same solvent.

Dilute 1.0 ml of the solution to 20.0 ml with *water R*.

Test reference and blank preparations. Label five 10 ml volumetric flasks A, B, C, D and E. Place 5 ml of the test solution in flasks A, B, C and D. To each of the flasks C and D add 0.5 ml of the reference solution. Dilute the contents of flasks A and C to 10 ml with *water R* (blank preparations A and C). Dilute the contents of flasks B and D to 10 ml with a freshly prepared 332 g/l solution of *potassium iodide R* (test preparation B and reference preparation D). Place 5 ml of a 332 g/l solution of *potassium iodide R* in flask E. Dilute to 10 ml with *water R* (blank preparation E).

Measure the absorbance (2.2.25) of each solution (A_a , A_b , A_c , A_d and A_e) at 323 nm using *water R* as the compensation liquid. Calculate the content of inorganic mercury compounds, expressed as Hg from the expression:

$$\frac{(A_b - A_a - A_e) \times m_R \times 0.1847}{(A_d - A_c - A_b + A_a) \times m_T}$$

m_R = mass of mercuric chloride in the reference solution in milligrams,

m_T = mass of the substance to be examined in milligrams.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator over *diphosphorus pentoxide R* at a pressure not exceeding 0.7 kPa for 24 h.

ASSAY

Place 0.5 g in a 100 ml long-necked combustion flask, add 5 ml of *sulphuric acid R* and heat gently until charring occurs, continue to heat and add dropwise *strong hydrogen*

peroxide solution R until the mixture is colourless. Dilute with *water R*, evaporate until slight fuming occurs, dilute to 10 ml with *water R*, cool down and titrate with 0.1 M ammonium thiocyanate using ferric ammonium sulphate solution R2 as indicator.

1 ml of 0.1 M ammonium thiocyanate is equivalent to 20.24 mg of $C_9H_9HgNaO_2S$.

STORAGE

Protected from light.

01/2005:0212

THIOPENTAL SODIUM AND SODIUM CARBONATE

Thiopentalum natricum et natrii carbonas

DEFINITION

Thiopental sodium and sodium carbonate is a mixture of the sodium derivative of 5-ethyl-5-[(1*RS*)-1-methylbutyl]-2-thioxo-2,3-dihydropyrimidine-4,6-(1*H*,5*H*)-dione ($C_{11}H_{17}N_2NaO_2S$; M_r 264.3) and anhydrous sodium carbonate, containing the equivalent of not less than 84.0 per cent and not more than 87.0 per cent of thiopental and not less than 10.2 per cent and not more than 11.2 per cent of Na, both calculated with reference to the dried substance.

CHARACTERS

A yellowish-white powder, hygroscopic, freely soluble in water, partly soluble in ethanol.

IDENTIFICATION

First identification: A, B, E.

Second identification: A, C, D, E.

A. Acidify 10 ml of solution S (see Tests) with *dilute hydrochloric acid R*. An effervescence is produced. Shake with 20 ml of *ether R*. Separate the ether layer, wash with 10 ml of *water R*, dry over *anhydrous sodium sulphate R* and filter. Evaporate the filtrate to dryness and dry the residue at 100 °C to 105 °C (test residue). Determine the melting point (2.2.14) of the test residue. Mix equal parts of the test residue and *thiopental CRS* and determine the melting point of the mixture. The difference between the melting points (which are about 160 °C) is not greater than 2 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing the test residue (see identification test A) with the spectrum obtained with *thiopental CRS*.

C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in *water R* and dilute to 100 ml with the same solvent.

Reference solution. Dissolve 85 mg of *thiopental CRS* in 10 ml of *dilute sodium hydroxide solution R* and dilute to 100 ml with *water R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 18 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*,

15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. It gives the reaction of non-nitrogen substituted barbiturates (2.3.1).

E. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution GY₃ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 1.0 g of the substance to be examined in *water R* and dilute to 100 ml with the same solvent. Disregard any slight residue.

Reference solution. Dilute 0.5 ml of the test solution to 100 ml with *water R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using the lower layer of a mixture of 5 volumes of *concentrated ammonia R*, 15 volumes of *alcohol R* and 80 volumes of *chloroform R*. Examine immediately in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent). Disregard any spot at the starting-point.

Chlorides (2.4.4). To 5 ml of solution S add 35 ml of *water R* and 10 ml of *dilute nitric acid R*. Shake with three quantities, each of 25 ml, of *ether R* and discard the ether layers. Eliminate the ether from the aqueous layer by heating on a water-bath. 15 ml of the aqueous layer complies with the limit test for chlorides (330 ppm).

Loss on drying (2.2.32). Not more than 2.5 per cent, determined on 0.50 g by drying in vacuo at 100 °C for 4 h.

ASSAY

Sodium. Dissolve 0.400 g in 30 ml of *water R*. Add 0.1 ml of *methyl red solution R* and titrate with 0.1 M *hydrochloric acid* until a red colour is obtained. Boil gently for 2 min. Cool and, if necessary, continue the titration with 0.1 M *hydrochloric acid* until the red colour is again obtained.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 2.299 mg of Na.

Thiopental. Dissolve 0.150 g in 5 ml of *water R*. Add 2 ml of *dilute sulphuric acid R* and shake with four quantities, each of 10 ml, of *chloroform R*. Combine the chloroform layers, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 30 ml of previously neutralised *dimethylformamide R* and add 0.1 ml of a 2 g/l solution of *thymol blue R* in *methanol R*. Titrate immediately with 0.1 M *lithium methoxide* until a blue colour is obtained. Protect the solution from atmospheric carbon dioxide during the titration.

1 ml of 0.1 M *lithium methoxide* is equivalent to 24.23 mg of $C_{11}H_{18}N_2O_2S$.

STORAGE

Store in an airtight container, protected from light.

01/2005:2005 *Reference solution (c).* Dilute 5.0 ml of reference solution (b) to 10.0 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*.

Plate: TLC silica gel R.

Mobile phase: *concentrated ammonia R*, *2-propanol R*, *methylene chloride R* (1:25:74 V/V/V).

Application: 5 µl; apply the test solution and reference solutions (b) and (c).

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution R* and 10 volumes of *dilute acetic acid R* and then with *dilute hydrogen peroxide solution R*. Immediately cover the plate with a glass plate.

Limits:

- *any impurity:* any spot, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent); not more than 2 such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.1 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g at 50 °C *in vacuo* for 4 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 37.06 mg of C₂₁H₂₆N₂S₂.

STORAGE

Protected from light.

IMPURITIES

- X = X' = SO₂: 10-[2-[(2RS)-1-methylpiperidin-2-yl]ethyl]-2-(methylsulphonyl)-10H-phenothiazine 5,5-dioxide,

THIORIDAZINE

Thioridazinum

C₂₁H₂₆N₂S₂

M_r 370.6

DEFINITION

10-[2-[(2RS)-1-Methylpiperidin-2-yl]ethyl]-2-(methylsulphonyl)-10H-phenothiazine

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubilities: practically insoluble in water, very soluble in methylene chloride, freely soluble in methanol, soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of thioridazine.

B. It complies with the identification of phenothiazines by thin-layer chromatography (2.3.3).

C. Dissolve 5 mg in 2 ml of *sulphuric acid R*. A blue colour is produced.

D. Dissolve 20 mg in a mixture of 2 ml of *water R* and 0.2 ml of 1 M *sulphuric acid*. Add 1 ml of a 50 g/l solution of *silver nitrate R*. No precipitate is produced.

TESTS

Solution S. Dissolve 1.25 g in *methanol R* and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Related substances. Thin-layer chromatography (2.2.27). Carry out the test as quickly as possible and protected from light. Apply the test solution last.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*. Dilute 5.0 ml of this solution to 10.0 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*.

Reference solution (b). Dilute 4.0 ml of reference solution (a) to 10.0 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*.

F. 2-(methylsulphanyl)-10-[2-[(2*RS*)-piperidin-2-yl]ethyl]-10*H*-phenothiazine.

01/2005:0586

THIORIDAZINE HYDROCHLORIDE

Thioridazini hydrochloridum

$C_{21}H_{27}ClN_2S_2$

M_r 407.0

DEFINITION

Thioridazine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 10-[2-[(2*RS*)-1-methylpiperidin-2-yl]ethyl]-2-(methylsulphanyl)-10*H*-phenothiazine hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water and in methanol, soluble in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *thioridazine hydrochloride CRS*.
- It complies with the identification of phenothiazines by thin-layer chromatography (2.3.3).
- 0.2 g gives reaction (b) of chlorides (2.3.1).

TESTS

Carry out all operations protected from light.

Appearance of solution. Dissolve 1.0 g in *methanol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than intensity 6 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.20 g in 20 ml of *carbon dioxide-free water R*. The pH of the solution is 4.2 to 5.2.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance. Carry out all operations as rapidly as possible, protected from light. Apply the test solution last.

Test solution. Dissolve 0.2 g in a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (a). Dilute 2 ml of the test solution to 100 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*. Dilute 10 ml of this solution to 100 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*.

Reference solution (b). Dilute 1 ml of the test solution to 100 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*. Dilute 10 ml of this solution to 100 ml with a mixture of 2 volumes of *concentrated ammonia R* and 98 volumes of *methanol R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *concentrated ammonia R*, 25 volumes of *2-propanol R* and 74 volumes of *chloroform R*. Allow the plate to dry in air. Spray first with a freshly prepared mixture of 1 volume of *potassium iodobismuthate solution R* and 10 volumes of *dilute acetic acid R* and then with freshly prepared *dilute hydrogen peroxide solution R*. Cover the plate immediately with a glass plate of the same size. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.2 per cent) and at most two such spots are more intense than the spot in the chromatogram obtained with the reference solution (b) (0.1 per cent). The test is not valid unless the spot in the chromatogram obtained with reference solution (b) is clearly visible.

Heavy metals (2.4.8). 1.0 g complies with the limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 4 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10 ml of *anhydrous acetic acid R* and 60 ml of *acetic anhydride R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 40.70 mg of $C_{21}H_{27}ClN_2S_2$.

STORAGE

Store protected from light.

01/2005:1049

THREONINE

Threoninum

$C_4H_9NO_3$

M_r 119.1

DEFINITION

Threonine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*S*,3*R*)-2-amino-3-hydroxybutanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder or colourless crystals, soluble in water, practically insoluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *threonine CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Mix 1 ml of a 2 g/l solution of the substance to be examined with 1 ml of a 20 g/l solution of *sodium periodate R*. Add 0.2 ml of *piperidine R* and 0.1 ml of a 25 g/l solution of *sodium nitroprusside R*. A blue colour develops that changes to yellow after a few minutes.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 5.0 to 6.5.

Specific optical rotation (2.2.7). Dissolve 1.50 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is -27.6 to -29.0 , calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *threonine CRS* in a 1 per cent V/V solution of *hydrochloric acid R* and dilute to 50 ml with the same acid solution.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *threonine CRS* and 10 mg of *proline CRS* in a 1 per cent V/V solution of *hydrochloric acid R* and dilute to 25 ml with the same acid solution.

Apply to the plate 5 µl of each solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated principal spots.

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dissolve 0.5 g in *distilled water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 5 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 11.91 mg of C₄H₉NO₃.

STORAGE

Store protected from light.

01/2005:0865

THYME

Thymi herba

DEFINITION

Whole leaves and flowers separated from the previously dried stems of *Thymus vulgaris* L. or *Thymus zygis* L. or a mixture of both species.

Content: minimum 12 ml/kg of essential oil of which a minimum of 40 per cent is thymol and carvacrol (both C₁₀H₁₄O; M_r 150.2) (anhydrous drug).

CHARACTERS

Strong aromatic odour reminiscent of thymol.

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaf of *Thymus vulgaris* is usually 4 mm to 12 mm long and up to 3 mm wide, sessile or with a very short petiole. The lamina is tough, entire, lanceolate to ovate, covered on both surfaces by a grey or greenish-grey indumentum; the edges are markedly rolled up towards the abaxial surface. The midrib is depressed on the adaxial surface and is very prominent on the abaxial surface. The calyx is green, often with violet spots and is tubular; at the end are 2 lips of which the upper one is bent back and at the end has 3 lobes, the lower is longer and has 2 hairy teeth. After flowering, the calyx tube is closed by a crown of long, stiff hairs. The corolla, about twice as long as the calyx, is usually brownish in the dry state and is slightly bilabiate.

The leaf of *Thymus zygis* is usually 1.7 mm to 6.5 mm long and 0.4 mm to 1.2 mm wide; it is acicular to linear-lanceolate and the edges are markedly rolled towards the abaxial surface. Both surfaces of the lamina are green to greenish-grey and the midrib is sometimes violet; the edges, in particular at the base, have long, white hairs. The dried flowers are very similar to those of *Thymus vulgaris*.

B. Reduce to a powder (355). The powder of both species is greyish-green or greenish-brown. Examine under a microscope using *chloral hydrate solution R*. The epidermises of the leaves have cells with anticlinal walls which are sinuous and beaded and the stomata are diacytic (2.8.3); numerous secretory trichomes made up of 12 secretory cells, the cuticle of which is generally raised by the secretion to form a globular to ovoid bladder-like covering; the glandular trichomes have a unicellular stalk and a globular to ovoid head; the covering trichomes of the adaxial surface are common to both species; they have warty walls and are shaped as pointed teeth; the warty covering trichomes of the abaxial surface are of many types: unicellular, straight or slightly curved, and bicellular or tricellular, and often elbow-shaped (*Thymus vulgaris*); bicellular or tricellular, more or less straight (*Thymus zygis*). Fragments of calyx are covered by numerous, uniseriate trichomes with 5 or 6 cells and with a weakly striated cuticle. Fragments of the corolla have numerous uniseriate covering trichomes, often collapsed, and secretory trichomes generally with 12 cells. Pollen grains are relatively rare, spherical and smooth with 6 germinal slit-like pores, measuring about 35 µm in diameter. The powder of *Thymus zygis* also contains numerous thick bundles of fibres from the main veins and from fragments of stems.

C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 5 ml of *methylene chloride R* and shake for 3 min, filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution. Dissolve 5 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R*.

Plate: TLC silica gel *F*₂₅₄ plate *R*.

Mobile phase: *methylene chloride R*.

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Thymol: a quenching zone	A prominent quenching zone A quenching zone (thymol)
	Quenching zones
Reference solution	Test solution

Detection B: spray with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and heat at 100-105 °C for 10 min.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third of the chromatogram obtained with the test solution. The intensity of the zones due to thymol and carvacrol depends upon the species examined.

Top of the plate	
Thymol: a brownish-pink zone Carvacrol: a pale violet zone	A brownish-pink zone (thymol) A pale violet zone (carvacrol)
	A greyish-pink zone A violet zone (cineole and linalol) A greyish-brown zone (borneol) A violet-blue zone An intense violet zone
Reference solution	Test solution

D. Examine the chromatograms obtained in the assay for thymol and carvacrol.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Foreign matter (2.8.2): maximum 10 per cent of stems and maximum 2 per cent of other foreign matter. Stems must not be more than 1 mm in diameter and 15 mm in length. Leaves with long trichomes at their base and with weakly pubescent other parts (*Thymus serpyllum L.*) are absent.

Water (2.2.13): maximum 100 ml/kg, determined on 20.0 g of the powdered drug (355).

Total ash (2.4.16): maximum 15.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1): maximum 3.0 per cent.

ASSAY

Essential oil (2.8.12). Use 30.0 g of the drug, a 1000 ml round-bottomed flask and 400 ml of *water R* as the distillation liquid. Distil at a rate of 2-3 ml/min for 2 h without *xylene R* in the graduated tube.

Thymol and carvacrol. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Filter the essential oil obtained in the determination of essential oil over a small amount of *anhydrous sodium sulphate R* and dilute to 5.0 ml with *hexane R* by rinsing the apparatus and the anhydrous sodium sulphate.

Reference solution. Dissolve 0.20 g of *thymol R* and 50 mg of *carvacrol R* in *hexane R* and dilute to 5.0 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** *l* = 30-60 m, Ø = 0.25 mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *nitrogen for chromatography R* or *helium for chromatography R*.

Flow rate: 1-2 ml/min.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 45	40 → 220
Injection port		190
Detector		210

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- resolution: minimum 1.5 between the peaks due to thymol and carvacrol.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution in the chromatogram obtained with the test solution.

Determine the percentage content of thymol and carvacrol. Disregard the peak due to hexane.

01/2005:1374

THYME OIL

Thymi aetheroleum

DEFINITION

Essential oil obtained by steam distillation from the fresh flowering aerial parts of *Thymus vulgaris* L., *T. zygis* Loeffl. ex L. or a mixture of both species.

CHARACTERS

Appearance: clear, yellow or very dark reddish-brown, mobile liquid with a characteristic, aromatic, spicy odour, reminiscent of thymol.

Solubility: miscible with ethanol and with light petroleum.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 0.2 g of the substance to be examined in pentane R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 0.15 g of thymol R, 25 mg of α-terpineol R, 40 µl of linalol R and 10 µl of carvacrol R in pentane R and dilute to 10 ml with the same solvent.

Plate: TLC silica gel plate R.

Mobile phase: ethyl acetate R, toluene R (5:95 V/V).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with anisaldehyde solution R and heat the plate at 100-105 °C for 5-10 min while observing. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other bands may be present in the chromatogram obtained with the test solution.

Top of the plate	
	A large violet zone (hydrocarbons) (at the solvent front)
Thymol: a brownish-pink zone	A brownish-pink zone (thymol)
Carvacrol: a pale violet zone	A pale violet zone (carvacrol)
Linalol: a violet zone	A violet zone (linalol)
α-Terpineol: a violet zone	A violet zone (α-terpineol)
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the characteristic peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.915 to 0.935.

Refractive index (2.2.6): 1.490 to 1.505.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution. Dissolve 0.15 g of β-myrcene R, 0.1 g of γ-terpinene R, 0.1 g of p-cymene R, 0.1 g of linalol R, 0.2 g of terpinen-4-ol R, 0.2 g of thymol R and 50 mg of carvacrol R in 5 ml of hexane R.

Column:

- material: fused silica,
- size: *l* = 30 m (a film thickness of 1 µm may be used) to 60 m (a film thickness of 0.2 µm may be used), Ø = 0.25-0.53 mm,
- stationary phase: macrogol 20 000 R.

Carrier gas: helium for chromatography R.

Split ratio: 1:100.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 15 15 - 55	60 60→180
Injection port		200
Detector		220

Detection: flame ionisation.

Injection: 0.2 µl.

Elution order: order indicated in the composition of the reference solution. Record the retention times of these substances.

System suitability: reference solution:

- resolution: minimum 1.5 between the peaks due to thymol and carvacrol,
- number of theoretical plates: minimum 30 000, calculated for the peak due to p-cymene at 80 °C.

Using the retention times determined from the chromatogram obtained with the reference solution, locate the components of the reference solution on the chromatogram obtained with the test solution. Disregard the peak due to hexane.

Determine the percentage content of these components. The limits are within the following ranges:

- β-myrcene: 1.0 per cent to 3.0 per cent,
- γ-terpinene: 5.0 per cent to 10.0 per cent,
- p-cymene: 15.0 per cent to 28.0 per cent,

- *linalol*: 4.0 per cent to 6.5 per cent,
- *terpinen-4-ol*: 0.2 per cent to 2.5 per cent,
- *thymol*: 36.0 per cent to 55.0 per cent,
- *carvacrol*: 1.0 per cent to 4.0 per cent.

STORAGE

In a well-filled, airtight container, protected from light, at a temperature not exceeding 25 °C.

01/2005:0791

THYMOL

Thymolum

C₁₀H₁₄OM_r 150.2

DEFINITION

Thymol is 5-methyl-2-(methylethyl)phenol.

CHARACTERS

Colourless crystals, very slightly soluble in water, very soluble in alcohol, freely soluble in essential oils and in fatty oils, sparingly soluble in glycerol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Melting point (2.2.14): 48 °C to 52 °C.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *thymol CRS*.
- Dissolve 0.2 g with heating in 2 ml of *dilute sodium hydroxide solution R* and add 0.2 ml of *chloroform R*. Heat on a water-bath. A violet colour develops.
- Dissolve about 2 mg in 1 ml of *anhydrous acetic acid R*. Add 0.15 ml of *sulphuric acid R* and 0.05 ml of *nitric acid R*. A bluish-green colour develops.

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of *dilute sodium hydroxide solution R*. The solution is not more opalescent than reference suspension IV (2.2.1) and not more intensely coloured than reference solution R₆ (2.2.2, *Method II*).

Acidity. To 1.0 g in a 100 ml glass-stoppered conical flask add 20 ml of *water R*. Boil until dissolution is complete, cool and stopper the flask. Shake vigorously for 1 min. Add a few crystals of the substance to be examined to initiate crystallisation. Shake vigorously for 1 min and filter. To 5 ml of the filtrate, add 0.05 ml of *methyl red solution R* and 0.05 ml of 0.01 M *sodium hydroxide*. The solution is yellow.

Related substances. Examine by gas chromatography (2.2.28).

Test solution. Dissolve 0.100 g in *alcohol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1 ml of the test solution to 100 ml with *alcohol R*.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with *alcohol R*.

Reference solution (c). Dilute 5 ml of reference solution (b) to 10 ml with *alcohol R*.

The chromatography may be carried out using:

- a glass or steel column 4 m long and 2 mm in internal diameter packed with *diatomaceous earth for gas chromatography R*, impregnated with a mixture suitable for the separation of free fatty acids,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 80 °C, that of the injection port at 250 °C and that of the detector at 300 °C.

Inject 1 µl of each solution and, after 2 min, increase the temperature of the column to 240 °C at a rate of 8 °C/min and maintain at this temperature for 15 min. The test is not valid unless the peak in the chromatogram obtained with reference solution (b) has a signal-to-noise ratio not less than five. In the chromatogram obtained with the test solution, the sum of the areas of the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent). Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with reference solution (c).

Residue on evaporation. Evaporate 2.00 g on a water-bath and heat in an oven at 100 °C to 105 °C for 1 h. The residue weighs not more than 1.0 mg (0.05 per cent).

STORAGE

Store protected from light.

01/2005:0866

TIABENDAZOLE

Tiabendazolum

C₁₀H₇N₃SM_r 201.2

DEFINITION

Tiabendazole contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 2-(thiazol-4-yl)-1H-benzimidazole, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, slightly soluble in alcohol and in methylene chloride. It dissolves in dilute mineral acids. It melts at about 300 °C.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- Dissolve 25 mg in 0.1 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. Dilute 2.0 ml of the solution to 100.0 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25), the solution shows two absorption maxima, at 243 nm and 302 nm. The ratio of the absorbance measured at the maximum at 302 nm to that measured at the maximum at 243 nm is 1.8 to 2.1.

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tiabendazole CRS*. Examine the substances prepared as discs.
- C. Examine the chromatograms obtained in the test for related substances in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Dissolve about 5 mg in 0.1 M hydrochloric acid and dilute to 5 ml with the same acid. Add 3 mg of *p*-phenylenediamine dihydrochloride *R* and shake until dissolved. Add 0.1 g of zinc powder *R*, mix, allow to stand for 2 min and add 5 ml of ferric ammonium sulphate solution *R2*. A bluish-violet colour develops.

TESTS

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel HF_{254} *R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in methanol *R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 20 ml with methanol *R*.

Reference solution (a). Dissolve 20 mg of *tiabendazole CRS* in methanol *R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with methanol *R*.

Reference solution (c). Dilute 1 ml of test solution (b) to 25 ml with methanol *R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 2.5 volumes of water *R*, 10 volumes of acetone *R*, 25 volumes of glacial acetic acid *R* and 62.5 volumes of toluene *R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.4 per cent).

***o*-Phenylenediamine.** To 5.0 g in a flask fitted with a ground-glass stopper, add 25 ml of a mixture of 1 volume of methanol *R* and 2 volumes of water *R*. Shake for 3 min. Filter through a sintered-glass filter (16) under reduced pressure. To 10 ml of the filtrate add 0.5 ml of hydrochloric acid *R* and 0.5 ml of acetylacetone *R* and shake until the solution is clear. The solution is not more intensely coloured than reference solution *R*₇ (2.2.2, Method I) (10 ppm).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 1.00 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.2 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 30 ml of anhydrous acetic acid *R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 20.12 mg of C₂₈H₄₇N₄O₄S.

STORAGE

Store protected from light.

IMPURITIES

A. benzene-1,2-diamine.

01/2005:1660

TIAMULIN FOR VETERINARY USE

Tiamulinum ad usum veterinarium

C₂₈H₄₇N₄O₄S

*M*_r 493.8

DEFINITION

(3*a*S,4*R*,5*S*,6*S*,8*R*,9*R*,9*a**R*,10*R*)-6-Ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3*a*,9-propano-3*a**H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphonyl]acetate.

Content: 96.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: sticky, translucent yellowish mass, slightly hygroscopic.

Solubility: practically insoluble in water, very soluble in methylene chloride, freely soluble in anhydrous ethanol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur.* reference spectrum of tiamulin.

TESTS

Appearance of solution. The solution is clear (2.2.1) and its absorbance (2.2.25) at 420 nm is maximum 0.050.

Dissolve 2.5 g in 50 ml of methanol *R*.

Related substances. Liquid chromatography (2.2.29).

Ammonium carbonate buffer solution pH 10.0. Dissolve 10.0 g of ammonium carbonate *R* in water *R*, add 22 ml of perchloric acid solution *R* and dilute to 1000.0 ml with water *R*. Adjust to pH 10.0 with concentrated ammonia *R1*.
Solvent mixture: ammonium carbonate buffer solution pH 10.0, acetonitrile *R1* (50:50 V/V).

Test solution. Dissolve 0.200 g of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 0.250 g of tiamulin hydrogen fumarate *CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dilute 0.1 ml of toluene *R* to 100 ml with acetonitrile *R*. Dilute 0.1 ml of this solution to 100.0 ml with the solvent mixture.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography R (5 μ m),
- temperature: 30 °C.

Mobile phase: acetonitrile R1, ammonium carbonate buffer solution pH 10.0, methanol R1 (21:30:49 V/V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 212 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of tiamulin.

Relative retention with reference to tiamulin (retention time = about 18 min): impurity A = about 0.22; impurity B = about 0.5; impurity C = about 0.66; impurity D = about 1.1; impurity F = about 1.6; impurity E = about 2.4.

System suitability: reference solution (a):

- baseline separation between the peaks due to tiamulin and impurity D.

Limits:

- impurities A, B, C, D, E, F: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- any other impurity: for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- total: not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- disregard limit: 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); disregard any peak present in the chromatogram obtained with reference solution (c).

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 80 °C.

Bacterial endotoxins (2.6.14, Method D): less than 0.4 IU/mg, determined in a 1 mg/ml solution in anhydrous ethanol R (endotoxin free) diluted 1:40 with water for bacterial endotoxins test.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{28}H_{47}NO_4S$, from the declared content of tiamulin hydrogen fumarate CRS.

STORAGE

Protected from light.

LABELLING

The label states where appropriate that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

Other detectable impurities: G, H, I, J, K, L, M, N, O, P, Q, R.

- A. $R_1 = R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5,8-dihydroxy-4,6,9,10-tetramethyloctahydro-3a,9-propano-3a*H*-cyclopentacycloocten-1(4*H*)-one (mutilin),
- G. $R_1 = CO-CH_2OH$, $R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl hydroxyacetate (pleuromutilin),
- J. $R_1 = CO-CH_3$, $R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl acetate (mutilin 14-acetate),
- K. $R_1 = H$, $R_2 = CO-CH_3$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-8-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-5-yl acetate (mutilin 11-acetate),
- L. $R_1 = CO-CH_2-O-SO_2-C_6H_4-pCH_3$, $R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[(4-methylphenyl)sulphonyl]oxy]acetate (pleuromutilin 22-tosylate),
- M. $R_1 = R_2 = CO-CH_3$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-5,8-diyl diacetate (mutilin 11,14-diacetate),
- P. $R_1 = CO-CH_2-O-SO_2-C_6H_5$, $R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [(phenylsulphonyl)oxy]acetate,

- B. $R = CH_2-C_6H_5$: 2-(benzylsulphanyl)-*N,N*-diethylethanamine,
- C. $R = S-CH_2-CH_2-N(C_2H_5)_2$: 2,2'-(disulphane-1,2-diyl)bis(*N,N*-diethylethanamine),
- O. $R = H$: 2-(diethylamino)ethanethiol,

- D. (3a*R*,4*R*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenylhydroxy-4,6,9,10-tetramethyl-5-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphonyl]acetate,

- E. (3a*S*,4*R*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-4,6,9,10-tetramethyl-1,5-dioxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphonyl]acetate (11-oxotiamulin),

- F. (1*R*,3a*R*,4*R*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-1-hydroxy-4,6,9,10-tetramethyl-5-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphonyl]acetate (1-hydroxy-11-oxotiamulin),

- H. (2*E*)-4-[[2-(3a*S*,4*R*,5*S*,6*R*,8*R*,9*R*,9a*R*,10*R*)-8-[[[2-(diethylamino)ethyl]sulphonyl]acetyl]oxy]-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-6-yl]-2-hydroxyethoxy]-4-oxobut-2-enoic acid (19,20-dihydroxytiamulin 20-fumarate),

- I. (2*E*)-4-[[2-(3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-8-[[[2-(diethylamino)ethyl]sulphonyl]acetyl]oxy]-6-ethenyl-1,5-dihydroxy-4,6,9,10-tetramethyldecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-2-yl]oxy]-4-oxobut-2-enoic acid (2,3-dihydroxytiamulin 2-fumarate),

- N. (2*E*)-4-[[2-[(3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl]oxy]-2-oxoethoxy]-4-oxobut-2-enoic acid (pleuromutilin 22-fumarate),

- Q. (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,10*R*)-6-ethenyl-2,5-dihydroxy-4,6,9,10-tetramethyl-2,3,4,5,6,7,8,9-octahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphonyl]acetate (3,4-didehydro-2-hydroxytiamulin),

- R. *N*-benzyl-*N,N*-dibutylbutan-1-aminium.

TIAMULIN HYDROGEN FUMARATE FOR VETERINARY USE

Tiamulini hydrogenofumaras ad usum
veterinarium

 $C_{32}H_{51}NO_8S$ M_r 610

DEFINITION

(3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-Ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl [[2-(diethylamino)ethyl]sulphonyl]acetate hydrogen (*E*)-but-2-enedioate.

Content: 96.5 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or light yellow, crystalline powder.

Solubility: soluble in water, freely soluble in anhydrous ethanol and soluble in methanol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: tiamulin hydrogen fumarate CRS.

TESTS

pH (2.2.3): 3.1 to 4.1.

Dissolve 0.5 g in carbon dioxide-free water *R* and dilute to 50 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Ammonium carbonate buffer solution pH 10.0. Dissolve 10.0 g of ammonium carbonate *R* in water *R*, add 22 ml of perchloric acid solution *R* and dilute to 1000.0 ml with water *R*. Adjust to pH 10.0 with concentrated ammonia *R1*.

Solvent mixture: ammonium carbonate buffer solution pH 10.0, *acetonitrile R1* (50:50 V/V).

Test solution. Dissolve 0.200 g of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dissolve 0.200 g of *tiamulin hydrogen fumarate CRS* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture.

Reference solution (c). Dissolve 40.0 mg of *fumaric acid R* in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (d). Dissolve 4 mg of *tiamulin for peak identification CRS* (tiamulin hydrogen fumarate containing impurities B, C, D, F, H and I) in the solvent mixture and dilute to 1 ml with the solvent mixture.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m),
- temperature: 30 °C.

Mobile phase: *acetonitrile R1*, ammonium carbonate buffer solution pH 10.0, *methanol R1* (21:30:49 V/V/V).

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 212 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of tiamulin.

Identification of impurities: use the chromatogram supplied with *tiamulin for peak identification CRS* and the chromatogram obtained with reference solution (d) to identify the peaks due to impurities B and H.

Relative retention with reference to tiamulin (retention time = about 18 min): impurity G = about 0.2; impurity A = about 0.22; impurity H = about 0.23; impurity I = about 0.3; impurity J = about 0.4; impurity K = about 0.45; impurity B = about 0.5; impurity L = about 0.65; impurity C = about 0.66; impurity F = about 0.8; impurity M = about 0.85; impurity D = about 1.1; impurity S = about 1.4; impurity T = about 1.6; impurity E = 2.4.

System suitability: reference solution (a):

- baseline separation between the peaks due to tiamulin and impurity D.

Limits:

- **impurities B, H:** for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (1.5 per cent),
- **impurities A, C, D, E, F, G, I, J, K, L, M, S, T:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1.0 per cent),
- **any other impurity:** for each impurity, not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (3.0 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); disregard any peak present in reference solution (c).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution and reference solution (a).

Calculate the percentage content of $C_{32}H_{51}NO_8S$ from the declared content of *tiamulin hydrogen fumarate CRS*.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I, J, K, L, M, S, T.

Other detectable impurities: N, O, P, Q, R.

- A. $R_1 = R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5,8-dihydroxy-4,6,9,10-tetramethyloctahydro-3a,9-propano-3a*H*-cyclopentacycloocten-1(4*H*)-one (mutilin),
- G. $R_1 = CO-CH_2OH$, $R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl hydroxyacetate (pleuromutilin),
- J. $R_1 = CO-CH_3$, $R_2 = H$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-5-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-8-yl acetate (mutilin 14-acetate),
- K. $R_1 = H$, $R_2 = CO-CH_3$: (3a*S*,4*R*,5*S*,6*S*,8*R*,9*R*,9a*R*,10*R*)-6-ethenyl-8-hydroxy-4,6,9,10-tetramethyl-1-oxodecahydro-3a,9-propano-3a*H*-cyclopentacycloocten-5-yl acetate (mutilin 11-acetate),

01/2005:2022

TIANEPTINE SODIUM

Tianeptinum natricum

C₂₁H₂₄ClN₂NaO₄S*M_r* 458.9

DEFINITION

Sodium 7-[[[(11*RS*)-3-chloro-6-methyl-6,11-dihydrodibenzo[*c,f*][1,2]thiazepin-11-yl]amino]heptanoate *S,S*-dioxide.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or yellowish powder, very hygroscopic.

Solubility: freely soluble in water, in methanol and in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of tianeptine sodium.

B. It gives reaction (a) of sodium (2.3.1).

TESTS

Impurity A. Gas chromatography (2.2.28).

Internal standard solution. Dilute 1 ml of *ethyl 5-bromovalerate R* in *ethanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 250.0 ml with *ethanol R*.

Test solution. Dissolve 0.1000 g of the substance to be examined in the internal standard solution and dilute to 2.0 ml with the same solution.

Reference solution. Dissolve 10.0 mg of *tianeptine impurity A CRS* in the internal standard solution and dilute to 200.0 ml with the same solution.

Column:

- **material:** fused silica,
- **size:** $l = 25$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** *poly(cyanopropyl)siloxane R* (film thickness 0.2 μ m).

Carrier gas: *helium for chromatography R*.

Linear velocity: 26 cm/s.

Split ratio: 1:100.

Temperature:

- **column:** 150 °C,
- **injection port and detector:** 210 °C.

Detection: flame ionisation.

Injection: 1 μ l.

Run time: twice the retention time of *ethyl 5-bromovalerate*.

System suitability: reference solution:

- **elution order:** ethanol, *ethyl 5-bromovalerate*, impurity A,
- **resolution:** minimum 10 between the peaks due to *ethyl 5-bromovalerate* and impurity A,
- **signal-to-noise ratio:** minimum 20 for the peak due to impurity A.

Limit:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Liquid chromatography (2.2.29).

Solvent mixture. Mix 50 volumes of *methanol R* and 50 volumes of *water for chromatography R*.

Test solution. Dissolve 50.0 mg of the substance to be examined in the solvent mixture and dilute to 50.0 ml with the solvent mixture.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the solvent mixture. Dilute 1.0 ml of this solution to 20.0 ml with the solvent mixture.

Reference solution (b). Dissolve 20.0 mg of *sodium tianeptine for system suitability CRS* in the solvent mixture and dilute to 200.0 ml with the solvent mixture.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *octadecylsilyl silica gel for chromatography R* (3 μ m) with a pore size of 0.01 μ m,
- **temperature:** 30 °C.

Mobile phase:

- **mobile phase A:** mix 21 volumes of *methanol R1*, 31.5 volumes of *acetonitrile R1* and 47.5 volumes of a 2 g/l solution of *sodium laurilsulfate R*, adjusted to pH 2.5 with *phosphoric acid R*,
- **mobile phase B:** mix 20 volumes of *methanol R1*, 20 volumes of a 2 g/l solution of *sodium laurilsulfate R*, adjusted to pH 2.5 with *phosphoric acid R* and 60 volumes of *acetonitrile R1*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 35	100	0
35 - 45	100 → 40	0 → 60
45 - 60	40	60
60 - 70	40 → 100	60 → 0

Flow rate: 1 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 μ l.

Relative retention with reference to tianeptine (retention time = about 30 min): impurity C = about 0.4; impurity D1 = about 0.6; impurity D2 = about 0.8; impurity E = about 1.1; impurity B = about 1.7.

System suitability: reference solution (b):

- **resolution:** minimum 2.5 between the peaks due to tianeptine and impurity E.

Limits:

- **any impurity:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 8 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): maximum 5.0 per cent, determined on 0.100 g.

ASSAY

Dissolve 0.165 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 22.95 mg of $C_{21}H_{24}ClN_2NaO_4S$.

STORAGE

In an airtight container.

IMPURITIES

A. $Br-[CH_2]_6-CO-O-C_2H_5$: *ethyl 7-bromoheptanoate*,

- B. $R = H$, $R' = [CH_2]_6-CO-O-C_2H_5$: ethyl 7-[(11*RS*)-3-chloro-6-methyl-6,11-dihydrodibenzo[*c,f*][1,2]thiazepin-11-yl]amino]heptanoate *S,S*-dioxide,
- E. $R = R' = [CH_2]_6-CO_2H$: 7,7'-[(11*RS*)-3-chloro-6-methyl-6,11-dihydrodibenzo[*c,f*][1,2]thiazepin-11-yl]imino]diheptanoic acid *S,S*-dioxide,

- C. $X = O$: 3-chloro-6-methyldibenzo[*c,f*][1,2]thiazepin-11(6*H*)-one *S,S*-dioxide,
- D. $X = N-[CH_2]_6-CO_2H$: 7-[(11*RS*)-3-chloro-6-methyldibenzo[*c,f*][1,2]thiazepin-11(6*H*)-ylidene]amino]heptanoic acid *S,S*-dioxide.

01/2005:1575

TIAPRIDE HYDROCHLORIDE

Tiapridi hydrochloridum

 $C_{15}H_{25}ClN_2O_4S$ M_r 364.9

DEFINITION

Tiapride hydrochloride contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of *N*-[2-(diethylamino)ethyl]-2-methoxy-5-(methylsulphonyl)benzamide hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white crystalline powder, very soluble in water, soluble in methanol, slightly soluble in ethanol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tiapride hydrochloride CRS*. Examine the substances prepared as discs.
- B. Solution S (see Tests) gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1). The absorbance (2.2.25) of solution S measured at 450 nm is not more than 0.030.

pH (2.2.3). The pH of solution S is 4.0 to 6.0.

Impurity C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 0.400 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 20.0 mg of *metoclopramide impurity E CRS* (tiapride impurity C) in *methanol R* and dilute to 50 ml with the same solvent. Dilute 2.0 ml of this solution to 20 ml with *methanol R*.

Apply to the plate 10 µl of the test solution and 10 µl of the reference solution. Develop over a path of 12 cm using a mixture of 2 volumes of *concentrated ammonia R*, 10 volumes of *dioxan R*, 14 volumes of *methanol R* and 90 volumes of *methylene chloride R*. Allow the plate to dry in air. Spray with a 2 g/l solution of *ninhydrin R* in *butanol R* and heat at 100 °C for 15 min. Any spot corresponding to impurity C in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *tiapride hydrochloride CRS* and 5.0 mg of *tiapride N-oxide CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a solution prepared as follows: dissolve 5.44 g of *potassium dihydrogen phosphate R* and 0.08 g of *sodium octanesulphonate R* in 780 ml of *water R*, adjust the pH to 2.7 using *phosphoric acid R* and dilute to 800 ml with *water R*; add 150 ml of *methanol R* and 50 ml of *acetonitrile R* and mix,
- as detector a spectrophotometer set at 240 nm, maintaining the temperature of the column at 40 °C.

Inject 10 µl of reference solution (b). The test is not valid unless the resolution between the peaks corresponding to tiapride (retention time of about 9 min) and tiapride *N-oxide* (retention time of about 13 min) is at least 4.0.

Inject 10 µl of the test solution. Continue the chromatography for 3 times the retention time of tiapride. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent) and the sum of the areas of any such peaks is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8). Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 20 ml of *anhydrous acetic acid R*. Add 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 36.49 mg of $C_{15}H_{25}ClN_2O_4S$.

IMPURITIES

A. R = CH₃: methyl 2-methoxy-5-(methylsulphonyl)benzoate,

B. R = H: 2-methoxy-5-(methylsulphonyl)benzoic acid,

C. *N,N*-diethylethane-1,2-diamine.

01/2005:1157

TIAPROFENIC ACID

Acidum tiaprofenicum

and enantiomer

$C_{14}H_{12}O_3S$

M_r 260.3

DEFINITION

Tiaprofenic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-2-(5-benzoylthiophen-2-yl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, freely soluble in acetone, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

A. Melting point (2.2.14): 95 °C to 99 °C.

B. Dissolve 25.0 mg in *ethanolic hydrochloric acid R* and dilute to 50.0 ml with the same solvent. Dilute 1.0 ml of the solution to 50.0 ml with *ethanolic hydrochloric*

acid R. Examined between 220 nm and 350 nm (2.2.25), the solution shows a shoulder at 262 nm and an absorption maximum at 305 nm. The specific absorbance at the maximum is 550 to 590.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tiaprofenic acid CRS*.

D. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 10 mg of *tiaprofenic acid CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *ketoprofen CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 2 ml with reference solution (a).

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of *acetic acid R*, 20 volumes of *methylene chloride R* and 80 volumes of *acetone R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The identification is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated principal spots.

TESTS

Appearance of solution. Dissolve 2.0 g in *alcohol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Optical rotation (2.2.7). Dissolve 0.50 g in *ethyl acetate R* and dilute to 10.0 ml with the same solvent. The angle of optical rotation is −0.10° to +0.10°.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 20.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 10.0 mg of *tiaprofenic acid impurity C CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 1.0 ml of reference solution (a) to 2.0 ml with reference solution (c).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 0.25 volumes of *water R*, 20 volumes of *glacial acetic acid R*, 500 volumes of *hexane R* and 500 volumes of *methylene chloride R*. Add the water to the acetic acid, then hexane and methylene chloride. Sonicate the mixture for 2 min. Do not degas with helium during analysis,

– as detector a spectrophotometer set at 250 nm.

Inject 20 µl of reference solution (d). When the chromatograms are recorded in the prescribed conditions the retention times relative to tiaprofenic acid are: impurity A 0.19, impurity B 0.43, impurity C 0.86.

Adjust the sensitivity of the system so that the heights of the principal peaks in the chromatogram obtained with reference solution (d) are at least 50 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained, the resolution between the peaks corresponding to tiaprofenic acid and impurity C is at least 3.0.

Inject 20 µl of the test solution, 20 µl of reference solution (a), 20 µl of reference solution (b) and 20 µl of reference solution (c). Continue the chromatography of the test solution for twice the retention time of tiaprofenic acid. In the chromatogram obtained with the test solution: the area of any peak corresponding to impurity C is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (c) (0.2 per cent); the area of any peak, apart from the principal peak and any peak corresponding to impurity C, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak and any peak corresponding to impurity C, is not greater than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent). Disregard any peak with an area less than half the area of the principal peak in the chromatogram obtained with the reference solution (b).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C in an oven at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 25 ml of *alcohol R*. Add 25 ml of *water R* and 0.5 ml of *phenolphthalein solution R*. Titrate with 0.1 M *sodium hydroxide*.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 26.03 mg of C₁₅H₁₄N₂O₆S₂.

STORAGE

Store protected from light.

IMPURITIES

A. R = C₂H₅: (5-ethylthiophen-2-yl)phenylmethanone,

B. R = CO-CH₃: 1-(5-benzoylthiophen-2-yl)ethanone,

F. R = Br: (5-bromothiophen-2-yl)phenylmethanone,

C. (2*RS*)-2-(5-benzoylthiophen-3-yl)propanoic acid,

D. benzoic acid,

E. (2*RS*)-2-(thiophen-2-yl)propanoic acid.

01/2005:0956

TICARCILLIN SODIUM

Ticarcillinum natricum

C₁₅H₁₄N₂Na₂O₆S₂

M_r 428.4

DEFINITION

Ticarcillin sodium contains not less than 89.0 per cent and not more than the equivalent of 100.5 per cent of disodium (2*S*,5*R*,6*R*)-6-[(2*RS*)-2-carboxylato-2-(thiophen-3-yl)acetyl]amino]-3,3-dimethyl-7-oxo-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellow powder, hygroscopic, freely soluble in water, soluble in methanol.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ticarcillin sodium CRS*.

B. Examine by thin-layer chromatography (2.2.27), using *silanised silica gel H R* as the coating substance.

Test solution. Dissolve 25 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *ticarcillin sodium CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *carbenicillin sodium CRS* and 25 mg of *ticarcillin sodium CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Apply to the plate 1 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *acetone R* and 90 volumes of a 154 g/l solution of *ammonium acetate R*, adjusted to pH 5.0 with *glacial acetic acid R*. Allow the plate to dry in a current of hot air and expose it to iodine vapour. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

C. Place about 2 mg in a test-tube about 15 cm long and 15 mm in diameter. Moisten with 0.05 ml of *water R* and add 2 ml of *sulphuric acid-formaldehyde reagent R*.

Mix the contents of the tube by swirling; the solution is brown. Place the test-tube in a water-bath for 1 min; a dark reddish-brown colour develops.

D. It gives reaction (a) of sodium (2.3.1).

TESTS

Solution S. Dissolve 2.50 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₅ (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 5.5 to 7.5.

Specific optical rotation (2.2.7). Dissolve 0.250 g in *water R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 172 to + 187, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in mobile phase A and dilute to 25.0 ml with the same mobile phase.

Reference solution (a). Dissolve 20.0 mg of *ticarcillin impurity A CRS* in mobile phase A and dilute to 100.0 ml with the same mobile phase. Dilute 5.0 ml of this solution to 50.0 ml with mobile phase A.

Reference solution (b). Dilute 1 ml of the test solution to 50 ml with mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min:

Mobile phase A. A 1.3 g/l solution of *ammonium phosphate R* adjusted to pH 7.0 with *phosphoric acid R*,

Mobile phase B. A mixture of equal volumes of mobile phase A and *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 – 30	100 → 30	0 → 70	linear gradient
30 – 40	30	70	isocratic
40 – 45	100	0	equilibration

- as detector a spectrophotometer at 220 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the two principal peaks are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the two principal peaks (diastereoisomers) is at least 2.0. Inject 20 µl of the test solution and 20 µl of reference solution (a). In the chromatogram obtained with the test solution: the area of any peak corresponding to ticarcillin impurity A is not greater than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (4 per cent); and the area of any peak apart from the two principal peaks and any peak corresponding to ticarcillin impurity A, is not greater than 1.25 times the area of the principal peak in the chromatogram obtained with the reference solution (a) (2.5 per cent).

N,N-Dimethylaniline (2.4.26, *Method B*). Not more than 20 ppm.

2-Ethylhexanoic acid (2.4.28). Not more than 0.5 per cent *m/m*.

Water (2.5.12). Not more than 5.5 per cent, determined on 0.150 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): less than 0.05 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution. Dissolve 50.0 mg of *ticarcillin sodium CRS* in the mobile phase and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 20 volumes of *methanol R* and 80 volumes of a 1.3 g/l solution of *ammonium phosphate R* (adjusted to pH 7.0 with *phosphoric acid R*),
- as detector a spectrophotometer set at 220 nm.

Inject 20 µl of the reference solution. Adjust the sensitivity of the system so that the heights of the two principal peaks are at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the two principal peaks is at least 2.5. Inject the reference solution six times. The test is not valid unless the relative standard deviation of the two peak areas for ticarcillin is at most 1.0 per cent. Inject alternately the test solution and the reference solution. Calculate the percentage content of ticarcillin sodium as the sum of the two peaks.

STORAGE

Store in an airtight container, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. (2*S*,5*R*,6*R*)-3,3-dimethyl-7-oxo-6-[(thiophen-3-yl)acetyl]amino-4-thia-1-azabicyclo[3.2.0]heptane-2-carboxylic acid (decarboxyticarcillin),

B. R = H: (thiophen-3-yl)acetic acid,

C. R = CO₂H: 2-(thiophen-3-yl)propanedioic acid (3-thienylmalonic acid),

- D. R = CO₂H: (4S)-2-[carboxy[[2-carboxy-2-(thiophen-3-yl)acetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penicilloic acids of ticarcillin),
- E. R = H: (4S)-2-[[[2-carboxy-2-(thiophen-3-yl)acetyl]amino]methyl]-5,5-dimethylthiazolidine-4-carboxylic acid (penilloic acids of ticarcillin).

TICLOPIDINE HYDROCHLORIDE

Ticlopidini hydrochloridum

C₁₄H₁₅Cl₂NS

M_r 300.2

DEFINITION

Ticlopidine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 5-(2-chlorobenzyl)-4,5,6,7-tetrahydrothieno[3,2-c]pyridine hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, sparingly soluble in water and in ethanol, very slightly soluble in ethyl acetate.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 40 mg in *water R* and dilute to 100.0 ml with the same solvent (solution A). Dilute 5.0 ml of solution A to 100.0 ml with *water R* (solution B). Examined between 200 nm and 350 nm (2.2.25), solution B shows two absorption maxima, at 214 nm and 232 nm. Examined between 250 nm and 350 nm, solution A shows two absorption maxima, at 268 nm and 275 nm. The ratio of the absorbance measured at the maximum at 268 nm to that measured at the maximum at 275 nm is 1.1 to 1.2.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ticlopidine hydrochloride CRS*. Examine the substances prepared as discs.
- C. Mix about 6 mg of *citric acid R* and 0.3 ml of *acetic anhydride R*. Add about 5 mg of the substance to be examined and heat in a water-bath at 80 °C. A red colour develops.
- D. About 20 mg gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 0.5 g in a 1 per cent V/V solution of *hydrochloric acid R* and dilute to 20 ml with the same acid solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 3.5 to 4.0.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.250 g of the substance to be examined in a mixture of 20 volumes of mobile phase B and 80 volumes of mobile phase A. Dilute to 50.0 ml with the same mixture of solvents.

Reference solution. Dissolve 5.0 mg of *ticlopidine impurity F CRS* in a mixture of 20 volumes of mobile phase B and 80 volumes of mobile phase A. Add 1.00 ml of the test solution and dilute to 100.0 ml with a mixture of 20 volumes of mobile phase B and 80 volumes of mobile phase A. Dilute 1.0 ml of this solution to 10.0 ml with a mixture of 20 volumes of mobile phase B and 80 volumes of mobile phase A.

The chromatographic procedure may be carried out using:

- a stainless steel column, 0.15 m long and 4.6 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.3 ml/min:

Mobile phase A. A 0.95 g/l solution of *sodium pentanesulphonate monohydrate R*, adjusted to pH 3.4 with a 50 per cent V/V solution of *phosphoric acid R*,

Mobile phase B. *Methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 45	80 → 20	20 → 80	linear gradient
45 - 50	20	80	isocratic
50 - 55	20 → 80	80 → 20	linear gradient

- as detector a spectrophotometer set at 220 nm, maintaining the temperature of the column at 40 °C.

Inject 10 µl of a mixture of 20 volumes of mobile phase B and 80 volumes of mobile phase A (blank). Inject 10 µl of the reference solution. When the chromatogram is recorded in the prescribed conditions the retention time for ticlopidine is about 15 min.

Adjust the sensitivity of the system so that, in the chromatogram obtained with the reference solution, the height of the peak due to ticlopidine is at least 5 per cent of the full scale of the recorder. The test is not valid unless in the chromatogram obtained with the reference solution: the resolution between the peaks corresponding to ticlopidine and impurity F is at least 2.0 (modify the pH of mobile phase A if necessary); the signal-to-noise ratio of the peak due to ticlopidine is at least 50.

Inject 10 µl of the test solution and 10 µl of the reference solution. In the chromatogram obtained with the test solution: the area of the peak corresponding to impurity F is not greater than half the area of the corresponding peak in the chromatogram obtained with the reference solution (0.05 per cent); the area of any peak, apart from the principal peak and the peak due to impurity F, is not greater than half the area of the principal peak in the chromatogram obtained with the reference solution (0.05 per cent); the sum of the areas of all the peaks apart from the peak corresponding to ticlopidine, is not greater than the area of the peak corresponding to ticlopidine in the chromatogram obtained with the reference solution (0.1 per cent). Disregard any peak with an area less than 0.1 times that of ticlopidine in the chromatogram obtained with the reference solution.

Formaldehyde. Dissolve 0.200 g in 4.0 ml of *water R*. Add 0.4 ml of *dilute sodium hydroxide solution R*. Centrifuge, filter the supernatant liquid through cotton previously impregnated with *water R* and dilute to 5.0 ml with *water R*. Transfer to a test-tube. Add 5.0 ml of *acetylacetone reagent R1*. Place the test-tube in a water-bath at 40 °C for 40 min. The test solution is not more intensely coloured than a standard prepared at the same time and in the same manner using 5.0 ml of a 0.8 ppm solution of formaldehyde (CH₂O), obtained by dilution of *formaldehyde standard solution (5 ppm CH₂O) R* with *water R* (20 ppm). Examine the tubes down their vertical axis.

Heavy metals (2.4.8). Dissolve 2.0 g in a 85 per cent V/V solution of *methanol R* and dilute to 20.0 ml with the same solvent. 12 ml of the solution complies with limit test B for heavy metals (10 ppm). Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Water (2.5.12). Not more than 0.5 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 15 ml of *anhydrous acetic acid R*. Add 35 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). 1 ml of 0.1 M *perchloric acid* is equivalent to 30.02 mg of C₁₄H₁₅Cl₂NS.

IMPURITIES

A. thieno[3,2-c]pyridine,

B. 6,7-dihydrothieno[3,2-c]pyridin-4(5*H*)-one,

C. (2-chlorophenyl)methanamine,

D. R₃ = R₄ = H: 5-benzyl-4,5,6,7-tetrahydrothieno[3,2-c]pyridine,

G. R₃ = Cl, R₄ = H: 5-(3-chlorobenzyl)-4,5,6,7-tetrahydrothieno[3,2-c]pyridine,

H. R₃ = H, R₄ = Cl: 5-(4-chlorobenzyl)-4,5,6,7-tetrahydrothieno[3,2-c]pyridine,

E. 5-(2-chlorobenzyl)thieno[3,2-c]pyridinium,

F. 6-(2-chlorobenzyl)-4,5,6,7-tetrahydrothieno[2,3-c]pyridine,

I. *N*-(2-chlorobenzyl)-2-(thiophen-2-yl)ethanamine,

J. *N,N'*-bis(2-chlorobenzyl)ethane-1,2-diamine,

K. 2,8-bis(2-chlorobenzyl)-1,2,3,4,6,7,8,9-octahydrothieno[3,2-*c'*]dipyridine (bis-ticlopidine),

L. 5-(2-chlorobenzyl)-6,7-dihydrothieno[3,2-c]pyridin-4(5*H*)-one.

01/2005:1767

TILIDINE HYDROCHLORIDE HEMIHYDRATE

Tilidini hydrochloridum hemihydricum

C₁₇H₂₄ClNO₂ · 1/2 H₂O

*M*_r 318.9

DEFINITION

Ethyl (1*R*,2*S*)-2-(dimethylamino)-1-phenylcyclohex-3-enecarboxylate hydrochloride hemihydrate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

A suitable antioxidant may be added.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of tilidine hydrochloride hemihydrate.

B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, Method II).

Acidity or alkalinity. To 20 ml of solution S add 0.2 ml of 0.01 M sodium hydroxide. The pH is not less than 4.1. Add 0.4 ml of 0.01 M hydrochloric acid. The pH is not more than 4.3.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dilute 0.5 ml of the test solution to 100.0 ml with *water R*.

Reference solution (b). Dilute 2.0 ml of reference solution (a) to 10.0 ml with *water R*.

Precolumn:

- size: $l = 4$ mm, $\varnothing = 4.0$ mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography R (5 μ m).

Column:

- size: $l = 0.125$ m, $\varnothing = 4.0$ mm,
- stationary phase: spherical octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: mix equal volumes of acetonitrile R and a 0.98 g/l solution of ammonium carbonate R.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 10 μ l.

Run time: twice the retention time of tilidine.

Relative retention with reference to tilidine (retention time = about 11 min): impurity D = about 0.4; impurity C = about 0.5; impurity B = about 0.7; impurity A = about 1.5.

Limits:

- **impurities A, B, C:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **any other impurity:** for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **disregard limit:** 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) R.

Water (2.5.12): 2.5 per cent to 3.1 per cent, determined on 0.300 g.

Bacterial endotoxins (2.6.14): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.250 g in a mixture of 10 ml of *anhydrous acetic acid R* and 50 ml of *acetic anhydride R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 30.99 mg of C₁₇H₂₄ClNO₂.

STORAGE

Protected from light.

LABELLING

The label states:

- where applicable, that the substance is free from bacterial endotoxins,
- where applicable, the name and concentration of any added antioxidant.

IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities: D.

A. ethyl (1*RS*,2*RS*)-2-(dimethylamino)-1-phenylcyclohex-3-enecarboxylate,

B. R = R' = CH₃: methyl (1*RS*,2*SR*)-2-(dimethylamino)-1-phenylcyclohex-3-enecarboxylate,

C. R = C₂H₅, R' = H: ethyl (1*RS*,2*SR*)-2-(methylamino)-1-phenylcyclohex-3-enecarboxylate,

D. ethyl (2*RS*)-3-dimethylamino-2-phenylpropanoate.

01/2005:0572 **Enantiomeric purity.** Examine by liquid chromatography (2.2.29). Carry out the test protected from actinic light.

TIMOLOL MALEATE

Timololi maleas

$C_{17}H_{28}N_4O_7S$

M_r 432.5

DEFINITION

Timolol maleate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (2S)-1-[(1,1-dimethylethyl)amino]-3-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-2-ol (*Z*)-butenedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder or colourless crystals, soluble in water and in alcohol.

It melts at about 199 °C, with decomposition.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- Dissolve 1.000 g in 1 M hydrochloric acid and dilute to 10.0 ml with the same acid. The specific optical rotation (2.2.7) is -5.7 to -6.2 .
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with timolol maleate CRS.
- Examine the chromatograms obtained in the test for related substances after exposure to iodine vapour. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Triturate 0.1 g with a mixture of 1 ml of dilute sodium hydroxide solution R and 3 ml of water R. Shake with three quantities, each of 5 ml, of ether R. To 0.1 ml of the aqueous layer add a solution of 10 mg of resorcinol R in 3 ml of sulphuric acid R. Heat on a water-bath for 15 min. No violet-red colour develops. Neutralise the remainder of the aqueous layer with dilute sulphuric acid R and add 1 ml of bromine water R. Heat on a water-bath for 15 min, then heat to boiling and cool. To 0.2 ml of this solution add a solution of 10 mg of resorcinol R in 3 ml of sulphuric acid R. Heat on a water-bath for 15 min; a violet-red colour develops. Add 0.2 ml of a 100 g/l solution of potassium bromide R and heat for 5 min on a water-bath. The colour becomes violet-blue.

TESTS

Solution S. Dissolve 0.5 g in carbon dioxide-free water R and dilute to 25 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B_s (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 3.8 to 4.3.

Enantiomeric purity. Examine by liquid chromatography (2.2.29). Carry out the test protected from actinic light.

Test solution. Dissolve 30.0 mg of the substance to be examined in a mixture of 1 volume of methylene chloride R and 3 volumes of 2-propanol R and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 30 mg of timolol maleate CRS in a mixture of 1 volume of methylene chloride R and 3 volumes of 2-propanol R and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 15.0 mg of (*R*)-timolol maleate CRS in a mixture of 1 volume of methylene chloride R and 3 volumes of 2-propanol R and dilute to 10.0 ml with the same mixture of solvents. Dilute 1.0 ml of the solution to 50.0 ml with a mixture of 1 volume of methylene chloride R and 3 volumes of 2-propanol R.

Reference solution (c). Dilute 1 ml of reference solution (a) to 100 ml with a mixture of 1 volume of methylene chloride R and 3 volumes of 2-propanol R. Mix 1 ml of this solution with 1 ml of reference solution (b).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with silica gel OD for chiral separations R (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 2 ml of diethylamine R, 40 ml of 2-propanol R and 960 ml of hexane R,
- as detector a spectrophotometer set at 297 nm.

Under these conditions the peak corresponding to the (*R*)-isomer appears first.

Inject 5 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained is at least 50 per cent of the full scale of the recorder. Inject 5 µl of each solution. The test is not valid unless: in the chromatogram obtained with reference solution (c), the resolution between the peaks corresponding to the (*R*)-enantiomer and to the (*S*)-enantiomer is at least 4.0; the retention times of the principal peaks (corresponding to the (*S*)-enantiomer) in the chromatograms obtained with the test solution and reference solution (a) are identical. In the chromatogram obtained with the test solution, the area of any peak corresponding to the (*R*)-enantiomer is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent).

Related substances. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel plate GF₂₅₄ R.

Test solution (a). Dissolve 0.50 g of the substance to be examined in methanol R and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with methanol R.

Reference solution (a). Dissolve 10 mg of timolol maleate CRS in methanol R and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 10 ml of test solution (b) to 50 ml with methanol R.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 1 volume of concentrated ammonia R, 20 volumes of methanol R and 80 volumes of methylene chloride R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard the spot remaining at the starting point.

Expose the plate to iodine vapour for 2 h. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.4 per cent). Disregard the spot remaining at the starting point.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 60 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 43.25 mg of $C_{17}H_{28}N_4O_7S$.

STORAGE

Store protected from light.

IMPURITIES

- A. (2R)-1-[(1,1-dimethylethyl)amino]-3-[[4-(morpholin-4-yl)-1,2,5-thiadiazol-3-yl]oxy]propan-2-ol (Z)-butenedioate.

01/2005:1051

TINIDAZOLE

Tinidazolum

$C_8H_{13}N_3O_4S$

M_r 247.3

DEFINITION

Tinidazole contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of 1-[2-(ethylsulphonyl)ethyl]-2-methyl-5-nitro-1*H*-imidazole, calculated with reference to the dried substance.

CHARACTERS

An almost white or pale yellow, crystalline powder, practically insoluble in water, soluble in acetone and in methylene chloride, sparingly soluble in methanol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

- A. Melting point (2.2.14): 125 °C to 128 °C.
- B. Dissolve 10.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *methanol R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 310 nm. The specific absorbance at the maximum is 340 to 360.

- C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tinidazole CRS*. Examine the substances prepared as discs.

- D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

- E. To about 10 mg add about 10 mg of *zinc powder R*, 0.3 ml of *hydrochloric acid R* and 1 ml of *water R*. Heat in a water-bath for 5 min and cool. The solution gives the reaction of primary aromatic amines (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in *acetone R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* with the aid of ultrasound and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1.0 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *tinidazole CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of test solution (b) to 20 ml with *methanol R*.

Reference solution (c). Dilute 4 ml of reference solution (b) to 10 ml with *methanol R*.

Reference solution (d). Dissolve 10 mg of *2-methyl-5-nitroimidazole R* (impurity A) in *methanol R* and dilute to 100 ml with the same solvent.

Reference solution (e). Dissolve 10 mg of *tinidazole impurity B CRS* in *methanol R* and dilute to 100 ml with the same solvent.

Heat the plate at 110 °C for 1 h and allow to cool.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 25 volumes of *butanol R* and 75 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spots corresponding to tinidazole impurity A and tinidazole impurity B in the chromatogram obtained with test solution (a) are not more intense than the corresponding spots in the chromatogram obtained with reference solutions (d) and (e) (0.5 per cent), respectively. Any spot, apart from the principal spot and any spots corresponding to tinidazole impurity A and tinidazole impurity B in the chromatogram obtained with test solution (a), is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Heavy metals (2.4.8). 1.0 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 25 ml of *anhydrous acetic acid R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 24.73 mg of $C_8H_{13}N_3O_4S$.

STORAGE

Store protected from light.

IMPURITIES

A. 2-methyl-5-nitro-1*H*-imidazole,

B. 1-[2-(ethylsulphonyl)ethyl]-2-methyl-4-nitro-1*H*-imidazole.

01/2005:1271

TINZAPARIN SODIUM

Tinzaparinum natricum

$n = 1$ to 25, $R = H$ or SO_3Na , $R' = H$ or SO_3Na or $CO-CH_3$
 $R_2 = H$ and $R_3 = CO_2Na$ or $R_2 = CO_2Na$ and $R_3 = H$

DEFINITION

Tinzaparin sodium is the sodium salt of a low-molecular-mass heparin that is obtained by controlled enzymatic depolymerisation of heparin from porcine intestinal mucosa using heparinase from *Flavobacterium heparinum*. The majority of the components have a 2-*O*-sulpho-4-enepyranosuronic acid structure at the non-reducing end and a 2-*N*,6-*O*-disulpho-D-glucosamine structure at the reducing end of their chain.

Tinzaparin sodium complies with the monograph on Low-molecular-mass heparins (0828) with the modifications and additional requirements below.

The mass-average molecular mass ranges between 5500 and 7500 with a characteristic value of about 6500.

The degree of sulphatation is 1.8 to 2.5 per disaccharide unit.

The potency is not less than 70 IU and not more than 120 IU of anti-factor Xa activity per milligram calculated with reference to the dried substance. The ratio of the anti-factor Xa activity to anti-factor IIa activity is between 1.5 and 2.5.

IDENTIFICATION

Carry out identification test C as described in the monograph for *Low-molecular-mass heparins (0828)*. The following requirements apply.

The mass-average molecular mass ranges between 5500 and 7500. The mass percentage of chains lower than 2000 is not more than 10.0 per cent. The mass percentage of chains between 2000 and 8000 ranges between 60.0 and 72.0 per cent. The mass percentage of chains above 8000 ranges between 22.0 and 36.0 per cent.

TESTS

Appearance of solution. Dissolve 1.0 g in 10 ml of *water R*. The solution is clear (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*)

Absorbance (2.2.25). Dissolve 50.0 mg in 100 ml of 0.01 M hydrochloric acid. The specific absorbance, measured at 231 nm and calculated with reference to the dried substance, is 8.0 to 12.5.

01/2005:2074

TIOCONAZOLE

Tioconazolum

 $C_{16}H_{13}Cl_3N_2OS$ M_r 387.7

DEFINITION

1-[(2*RS*)-2-[(2-Chlorothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1*H*-imidazole.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: very slightly soluble in water, very soluble in methylene chloride, freely soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of tioconazole.*

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 2.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of *tioconazole for system suitability CRS* in the mobile phase and dilute to 2.5 ml with the mobile phase.

Column:

— *size:* $l = 0.25$ m, $\varnothing = 4.6$ mm,

- *stationary phase*: end-capped octadecylsilyl silica gel for chromatography *R* (5 µm) with a specific surface area of 170 m²/g, a pore size of 12 nm and a carbon loading of 10 per cent.

Mobile phase: mix 1 volume of a 1.7 g/l solution of tetrabutylammonium dihydrogen phosphate *R* previously adjusted to pH 7.4 with dilute ammonia *R*2 and 3 volumes of methanol *R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 218 nm.

Injection: 20 µl.

Run time: 2.5 times the retention time of tioconazole.

System suitability: reference solution (b):

- *resolution*: minimum 1.0 between the peaks due to impurity B and impurity C (locate impurities A, B and C by comparison with the chromatogram provided with tioconazole for system suitability CRS).

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 1.7; impurity C = 1.7.
- *impurities A, B, C*: for each impurity, not more than 1.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent),
- *any other impurity*: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- *total*: not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (1.0 per cent),
- *disregard limit*: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.05 per cent).

Water (2.5.12): maximum 0.5 per cent, determined on 1.00 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in 50 ml of anhydrous acetic acid *R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 38.77 mg of C₁₆H₁₃Cl₃N₂OS.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

Other detectable impurities: D.

- A. R1 = R2 = H: 1-[(2RS)-2-(2,4-dichlorophenyl)-2-[(thiophen-3-yl)methoxy]ethyl]-1H-imidazole,

- B. R1 = R2 = Cl: 1-[(2RS)-2-(2,4-dichlorophenyl)-2-[(2,5-dichlorothiophen-3-yl)methoxy]ethyl]-1H-imidazole,

- C. R1 = Cl, R2 = Br: 1-[(2RS)-2-[(5-bromo-2-chlorothiophen-3-yl)methoxy]-2-(2,4-dichlorophenyl)ethyl]-1H-imidazole,

- D. (1RS)-1-(2,4-dichlorophenyl)-2-(1H-imidazol-1-yl)ethanol.

01/2005:0150

TITANIUM DIOXIDE

Titanii dioxidum

TiO₂

M_r 79.9

DEFINITION

Titanium dioxide contains not less than 98.0 per cent and not more than the equivalent of 100.5 per cent of TiO₂.

CHARACTERS

A white or almost white powder, practically insoluble in water. It does not dissolve in dilute mineral acids but dissolves slowly in hot concentrated sulphuric acid.

IDENTIFICATION

- When strongly heated, it becomes pale yellow; the colour disappears on cooling.
- To 5 ml of solution S2 (see Tests) add 0.1 ml of *strong hydrogen peroxide solution R*. An orange-red colour appears.
- To 5 ml of solution S2 add 0.5 g of *zinc R* in granules. After 45 min, the mixture has a violet-blue colour.

TESTS

Solution S1. Shake 20.0 g with 30 ml of *hydrochloric acid R* for 1 min. Add 100 ml of *distilled water R* and heat the mixture to boiling. Filter the hot mixture through a hardened filter paper until a clear filtrate is obtained. Wash the filter with 60 ml of *distilled water R* and dilute the combined filtrate and washings to 200 ml with *distilled water R*.

Solution S2. Mix 0.500 g (*m* g) with 5 g of *anhydrous sodium sulphate R* in a 300 ml long-necked combustion flask. Add 10 ml of *water R* and mix. Add 10 ml of *sulphuric acid R* and boil vigorously, with the usual precautions, until a clear solution is obtained. Cool, add slowly a cooled mixture of 30 ml of *water R* and 10 ml of *sulphuric acid R*, cool again and dilute to 100.0 ml with *water R*.

Appearance of solution. Solution S2 is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

Acidity or alkalinity. Shake 5.0 g with 50 ml of *carbon dioxide-free water R* for 5 min. Centrifuge or filter until a clear solution is obtained. To 10 ml of the solution add 0.1 ml of *bromothymol blue solution R1*. Not more than 1.0 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Water-soluble substances. To 10.0 g add a solution of 0.5 g of *ammonium sulphate R* in 150 ml of *water R* and boil for 5 min. Cool, dilute to 200 ml with *water R* and filter until a clear solution is obtained. Evaporate 100 ml of the solution to dryness in a tared evaporating dish and ignite. The residue weighs not more than 25 mg (0.5 per cent).

Antimony. To 10 ml of solution S2 add 10 ml of *hydrochloric acid R* and 10 ml of *water R*. Cool to 20 °C, if necessary, and add 0.15 ml of *sodium nitrite solution R*. After 5 min, add 5 ml of a 10 g/l solution of *hydroxylamine hydrochloride R* and 10 ml of a freshly prepared 0.1 g/l solution of *rhodamine B R*. Mix thoroughly after each addition. Shake vigorously with 10.0 ml of *toluene R* for 1 min. Allow to separate and centrifuge for 2 min if necessary. Any pink colour in the toluene phase is not more intense than that in the toluene phase of a standard prepared at the same time in the same manner using a mixture of 5.0 ml of *antimony standard solution (1 ppm Sb) R*, 10 ml of *hydrochloric acid R* and 15 ml of a solution containing 0.5 g of *anhydrous sodium sulphate R* and 2 ml of *sulphuric acid R* instead of the mixture of 10 ml of solution S2, 10 ml of *hydrochloric acid R* and 10 ml of *water R* (100 ppm).

Arsenic (2.4.2). Place 0.50 g in a 250 ml round-bottomed flask, fitted with a thermometer, a funnel with stopcock and a vapour-outlet tube connected to a flask containing 30 ml of *water R*. Add 50 ml of *water R*, 0.5 g of *hydrazine sulphate R*, 0.5 g of *potassium bromide R* and 20 g of *sodium chloride R*. Through the funnel, add dropwise 25 ml of *sulphuric acid R*, heat and maintain the temperature of the liquid at 110 °C to 115 °C for 20 min. Collect the vapour in the flask containing 30 ml of *water R*. Dilute to 50 ml with *water R*. 20 ml of the solution complies with limit test A for arsenic (5 ppm).

Barium. To 10 ml of solution S1 add 1 ml of *dilute sulphuric acid R*. After 30 min, any opalescence in the solution is not more intense than that in a mixture of 10 ml of solution S1 and 1 ml of *distilled water R*.

Heavy metals (2.4.8). Dilute 10 ml of solution S1 to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Iron. To 8 ml of solution S2 add 4 ml of *water R*. Mix and add 0.05 ml of *bromine water R*. Allow to stand for 5 min and remove the excess of bromine with a current of air. Add 3 ml of *potassium thiocyanate solution R*. Any colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using a mixture of 4 ml of *iron standard solution (2 ppm Fe) R* and 8 ml of a 200 g/l solution of *sulphuric acid R* (200 ppm).

ASSAY

To 300 g of *zinc R* in granules (710) add 300 ml of a 20 g/l solution of *mercuric nitrate R* and 2 ml of *nitric acid R*, shake for 10 min and wash with *water R*. Pack the amalgamated zinc into a glass tube about 400 mm long and about 20 mm in diameter fitted with a tap and a filter plate. Pass through the column 100 ml of *dilute sulphuric acid R* followed by 100 ml of *water R*, making sure that the amalgam is always covered with liquid. Pass slowly at a rate of about 3 ml/min through the column a mixture of 100 ml of *dilute sulphuric acid R* and 100 ml of *water R* followed by 100 ml of *water R*. Collect the eluate in a 500 ml conical flask containing 50.0 ml of a 150 g/l solution of *ferric ammonium sulphate R* in a mixture of 1 volume of *sulphuric acid R* and 3 volumes of *water R*. Add 0.1 ml of *ferroin R* and titrate immediately with 0.1 M *ammonium and cerium nitrate* until a greenish colour is obtained

(n_1 ml). Pass slowly at a rate of about 3 ml/min through the column a mixture of 50 ml of *dilute sulphuric acid R* and 50 ml of *water R*, followed by 20.0 ml of solution S2, a mixture of 50 ml of *dilute sulphuric acid R* and 50 ml of *water R* and finally 100 ml of *water R*. Collect the eluate in a 500 ml conical flask containing 50.0 ml of a 150 g/l solution of *ferric ammonium sulphate R* in a mixture of 1 volume of *sulphuric acid R* and 3 volumes of *water R*. Rinse the lower end of the column with *water R*, add 0.1 ml of *ferroin R* and titrate immediately with 0.1 M *ammonium and cerium nitrate* until a greenish colour is obtained (n_2 ml).

Calculate the percentage content of TiO_2 from the expression:

$$\frac{3.99 \times (n_2 - n_1)}{m}$$

m = mass in grams of the substance to be examined used for the preparation of solution S2.

01/2005:0645

TOBRAMYCIN

Tobramycinum

 $\text{C}_{18}\text{H}_{37}\text{N}_5\text{O}_9$
 M_r 467.5

DEFINITION

4-O-(3-Amino-2-deoxy-α-D-glucopyranosyl)-2-deoxy-6-O-(2,6-diamino-2,3,6-trideoxy-α-D-ribohexopyranosyl)-L-streptomine.

Substance produced by *Streptomyces tenebrarius* or obtained by any other means.

Content: 97.0 per cent to 102.0 per cent (anhydrous and 2-methyl-1-propanol-free substance).

PRODUCTION

It is produced by methods of manufacture designed to eliminate or minimise substances lowering blood pressure.

CHARACTERS

Appearance: white or almost white powder.

Solubility: freely soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A.

Second identification: B, C.

A. Nuclear magnetic resonance spectrometry (2.2.33).

Preparation: 100 g/l solution in *deuterium oxide R*.

Comparison: 100 g/l solution of *tobramycin CRS* in *deuterium oxide R*.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 20 mg of the substance to be examined in *water R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *tobramycin CRS* in *water R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 4 mg of *neomycin sulphate CRS* and 4 mg of *kanamycin monosulphate CRS* in 1 ml of reference solution (a).

Plate: *TLC silica gel plate R*.

Mobile phase: *methylene chloride R*, *concentrated ammonia R*, *methanol R* (17:33:50 *V/V/V*).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection: spray with a mixture of equal volumes of a 2 g/l solution of *1,3-dihydroxynaphthalene R* in *alcohol R* and a 460 g/l solution of *sulphuric acid R*. Heat at 105 °C for 5-10 min.

System suitability: the chromatogram obtained with reference solution (b) shows 3 major spots which are clearly separated.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

- C. Dissolve about 5 mg in 5 ml of *water R*. Add 5 ml of a 1 g/l solution of *ninhydrin R* in *alcohol R* and heat in a water-bath for 3 min. A violet-blue colour develops.

TESTS

pH (2.2.3): 9.0 to 11.0.

Dissolve 1.0 g in 10 ml of *carbon dioxide-free water R*.

Specific optical rotation (2.2.7): + 138 to + 148 (anhydrous and 2-methyl-1-propanol-free substance).

Dissolve 1.00 g in *water R* and dilute to 25.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 25.0 mg of the substance to be examined in *water R* and dilute to 25.0 ml with the same solvent.

Test solution (b). Dilute 10.0 ml of test solution (a) to 100.0 ml with *water R*.

Reference solution (a). Dissolve 25.0 mg of *tobramycin CRS* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 50.0 ml with *water R*.

Reference solution (d). Dissolve 10.0 mg of *kanamycin B CRS* in 20.0 ml of *water R*. To 1.0 ml, add 2.0 ml of reference solution (a) and dilute to 10.0 ml with *water R*.

Reference solution (e). Dilute 10.0 ml of reference solution (a) to 25.0 ml with *water R*.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** *styrene-divinylbenzene copolymer R* (8 µm) with a pore size of 100 nm,
- **temperature:** 55 °C.

Mobile phase: a mixture prepared with *carbon dioxide-free water R* containing 52 g/l of *anhydrous sodium sulphate R*, 1.5 g/l of *sodium octanesulphonate R*, 3 ml/l of *tetrahydrofuran R*, 50 ml/l of 0.2 M *potassium dihydrogen phosphate R* previously adjusted to pH 3.0 with *dilute phosphoric acid R*. Degas.

Flow rate: 1.0 ml/min.

Post-column solution: *carbonate-free sodium hydroxide solution R* diluted 1 to 25 with *carbon dioxide-free water R*, which is added pulseless to the column effluent using a 375 µl polymeric mixing coil.

Flow rate: 0.3 ml/min.

Detection: pulsed amperometric detector or equivalent with a gold working electrode, a silver-silver chloride reference electrode and a stainless steel auxiliary electrode which is the cell body, held at respectively + 0.05 V detection, + 0.75 V oxidation and – 0.15 V reduction potentials, with pulse durations according to the instrument used. The temperature of the detector is set at 35 °C.

Injection: 20 µl; inject test solution (a) and reference solutions (b), (c) and (d).

Run time: 1.5 times the retention time of tobramycin.

Relative retention with reference to tobramycin (retention time = about 18 min): impurity C = about 0.35; impurity B = about 0.40, impurity A = about 0.70.

System suitability:

- **resolution:** minimum of 3.0 between the peaks due to impurity A and to tobramycin in the chromatogram obtained with reference solution (d). If necessary, adjust the concentration of sodium octanesulphonate in the mobile phase;
- **signal-to-noise ratio:** minimum of 10 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

- **any impurity:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent) and not more than 1 such peak has an area greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- **total:** not more than 3 times the area of the principal peak in the chromatogram obtained with reference solution (c) (1.5 per cent),
- **disregard limit:** the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent).

2-Methyl-1-propanol (2.4.24, *System B*): maximum 1.0 per cent *m/m*.

Water (2.5.12): maximum 8.0 per cent, determined on 0.30 g.

Sulphated ash (2.4.14): maximum 0.3 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 2.0 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modifications.

Injection: test solution (b) and reference solution (e).

Calculate the percentage content of tobramycin.

STORAGE

If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. 4-O-(3-amino-3-deoxy- α -D-glucopyranosyl)-2-deoxy-6-O-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-L-streptamine (kanamycin B),

- B. R = H: 2-deoxy-4-O-(2,6-diamino-2,3,6-trideoxy- α -D-ribohexopyranosyl)-D-streptamine (nebramine),
C. R = OH: 2-deoxy-4-O-(2,6-diamino-2,6-dideoxy- α -D-glucopyranosyl)-D-streptamine (neamine).

01/2005:0692

all-*rac*- α -TOCOPHEROLint-*rac*- α -Tocopherolum $C_{29}H_{50}O_2$ M_r 430.7

DEFINITION

all-*rac*-2,5,7,8-Tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydro-2*H*-1-benzopyran-6-ol.

Content: 96.0 per cent to 101.5 per cent.

CHARACTERS

Appearance: clear, colourless or yellowish-brown, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol, in methylene chloride and in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

- A. Optical rotation (2.2.7): -0.01° to $+0.01^\circ$.

Dissolve 2.50 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

- B. Infrared absorption spectrophotometry (2.2.24).

Comparison: α -tocopherol CRS.

- C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Reference solution. Dissolve 10 mg of α -tocopherol CRS in 2 ml of *cyclohexane R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ether R*, *cyclohexane R* (20:80 V/V).

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of α -tocopherol CRS in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of the substance to be examined and 10 mg of α -tocopheryl acetate *R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of all-*rac*- α -tocopherol for peak identification CRS in *cyclohexane R* and dilute to 1 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *cyclohexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *cyclohexane R*.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** poly(dimethyl)siloxane *R* (film thickness 0.25 μ m).

Carrier gas: helium for chromatography *R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

- **column:** 280 $^\circ$ C,
- **injection port and detector:** 290 $^\circ$ C.

Detection: flame ionisation.

Injection: 1 μ l of test solution (b) and reference solutions (b), (c) and (d).

Run time: twice the retention time of all-*rac*- α -tocopherol.

Relative retention with reference to all-*rac*- α -tocopherol (retention time = about 13 min): *squalane* = about 0.5; impurity A = about 0.7; impurity B = about 0.8. Use the chromatogram supplied with the CRS and the chromatogram obtained with reference solution (c) to identify the peaks due to impurities A and B.

System suitability: reference solution (b):

- **resolution:** minimum 3.5 between the peaks due to all-*rac*- α -tocopherol and α -tocopheryl acetate.

Limits:

- **impurity A:** maximum 0.5 per cent,

- *impurity B*: maximum 1.5 per cent,
- *any other impurity*: for each impurity, maximum 0.25 per cent,
- *total*: maximum 2.5 per cent,
- *disregard limit*: the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

ASSAY

Gas chromatography (2.2.28) as described in the test for related substances with the following modification.

Injection: test solution (a) and reference solution (a).

Calculate the percentage content of $C_{29}H_{50}O_2$ taking into account the declared content of α -tocopherol CRS.

STORAGE

Under an inert gas, protected from light.

IMPURITIES

Specified impurities: A, B.

- A. all-*rac-trans*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-ol,

- B. all-*rac-cis*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-ol.

01/2005:1256

RRR- α -TOCOPHEROL

RRR- α -Tocopherolum

$C_{29}H_{50}O_2$

M_r 430.7

DEFINITION

RRR- α -Tocopherol contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of (2*R*)-2,5,7,8-tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-ol.

CHARACTERS

A clear, colourless or yellowish-brown, viscous, oily liquid, practically insoluble in water, freely soluble in acetone, in ethanol, in methylene chloride and in fatty oils.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. It complies with the test for absorbance (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with α -tocopherol CRS.

C. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F_{254} plate R.

Test solution. Dissolve 10 mg of the substance to be examined in 2 ml of cyclohexane R.

Reference solution. Dissolve 10 mg of α -tocopherol CRS in 2 ml of cyclohexane R.

Apply separately to the plate 10 μ l of each solution.

Develop over a path of 15 cm using a mixture of 20 volumes of ether R and 80 volumes of cyclohexane R. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution. Spray the plate with a mixture of 10 volumes of hydrochloric acid R, 40 volumes of a 2.5 g/l solution of ferric chloride R in alcohol R and 40 volumes of a 10 g/l solution of phenanthroline hydrochloride R in alcohol R. After 1 h to 2 h, the principal spots are orange.

D. RRR- α -tocopherol is dextrorotatory (2.2.7). The specific optical rotation after oxidation to the quinone form is not less than + 24.

Dissolve 1.0 g of the substance to be examined in 50 ml of ether R. To the solution add 20 ml of a 100 g/l solution of potassium ferricyanide R in an 8 g/l solution of sodium hydroxide R and shake for 3 min. Wash the ether solution with four quantities, each of 50 ml, of water R, discard the washings and dry the ether layer over anhydrous sodium sulphate R. Evaporate the ether on a water-bath under reduced pressure or in an atmosphere of nitrogen until a few millilitres remain, then complete the evaporation removing the last traces of ether without the application of heat. Immediately dissolve the residue in 5.0 ml of trimethylpentane R and determine the optical rotation.

Calculate the specific optical rotation of the substance in the test solution using as *c* the number of grams of RRR- α -tocopherol in 1000 ml.

TESTS

Absorbance (2.2.25). Dissolve 0.100 g in ethanol R and dilute to 100 ml with the same solvent (solution A). Dilute 10.0 ml of solution A to 100.0 ml with ethanol R (solution B). Measure the absorbance of solution B at the maximum at 292 nm and of solution A at the minimum at 255 nm. The specific absorbance at the maximum is 72.0 to 76.0 and that at the minimum is 5.5 to 8.0.

Acid value (2.5.1). Not more than 2.0, determined on 2.00 g.

Heavy metals (2.4.8). 0.50 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 1 ml of lead standard solution (10 ppm Pb) R.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g. Use sulphuric acid R instead of dilute sulphuric acid R.

ASSAY

Examine by gas chromatography (2.2.28), using dotriacontane R as the internal standard.

Internal standard solution. Dissolve 0.300 g of dotriacontane *R* in hexane *R* and dilute to 100.0 ml with the same solvent.

Test solution. Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution, dilute to 50.0 ml with hexane *R* and mix.

Reference solution. Dissolve 0.100 g of α -tocopherol CRS in 10.0 ml of the internal standard solution, dilute to 50.0 ml with hexane *R* and mix.

The chromatographic procedure may be carried out using:

- a fused-silica column, 15 m long and 0.32 mm in internal diameter coated with a 0.25 μ m layer of poly(dimethyl)siloxane *R*,
- helium for chromatography *R* as the carrier gas at a flow rate of 3 ml/min to 6 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the injection port at 300 °C and that of the detector at 330 °C. Adjust the split ratio between 1 to 10 and 1 to 20. Set the temperature of the column at 200 °C, then raise the temperature at a rate of 5 °C per minute to 250 °C and maintain at 250 °C for 10 min.

Inject directly onto the column or via a glass-lined injection port using an automatic injection device or some other reproducible injection method. Measure the peak areas by electronic integration. The test is not valid unless in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to dotriacontane and α -tocopherol is at least 9.0.

Interference test. Dissolve 0.100 g of the substance to be examined in hexane *R* and dilute to 50.0 ml with the same solvent. Inject 1 μ l of the solution and record the chromatogram. If a peak is detected with the same t_R value as for dotriacontane, calculate the area of this peak relative to the peak area of α -tocopherol. If the relative peak area is greater than 0.5 per cent, use the corrected peak area $S'_{D(\text{corr})}$ for the final calculation.

$$S'_{D(\text{corr})} = S'_D - \frac{S_I \times S'_T}{S_{TI}}$$

- S'_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,
- S_I = area of the interfering peak (same t_R value as that of the internal standard) in the chromatogram obtained in the interference test,
- S'_T = area of the peak corresponding to α -tocopherol in the chromatogram obtained with the test solution,
- S_{TI} = area of the peak corresponding to α -tocopherol in the chromatogram obtained in the interference test.

Once the system suitability has been established, inject 1 μ l of the reference solution and record the chromatogram. Measure the areas of the peaks corresponding to α -tocopherol (S_T) and dotriacontane (S_D) and determine the response factor (RF) as described below.

Determine the response factor (RF) for α -tocopherol in the chromatogram obtained with the reference solution from the area of the peak corresponding to α -tocopherol and the peak corresponding to dotriacontane using the expression:

$$\text{RF} = \frac{S_D \times m_T}{S_T \times m_D}$$

Inject 1 μ l of the test solution in the same manner. Measure the areas of the peaks corresponding to α -tocopherol (S'_T) and dotriacontane (S'_D).

Calculate the percentage content of *RRR*- α -tocopherol using the expression:

$$\frac{100 (S'_T \times m_D \times \text{RF})}{S'_{D(\text{corr})} \times m}$$

- S_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the reference solution,
- $S'_{D(\text{corr})}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,
- S_T = area of the peak corresponding to α -tocopherol CRS in the chromatogram obtained with the reference solution,
- S'_T = area of the peak corresponding to α -tocopherol in the chromatogram obtained with the test solution,
- m_D = mass of the internal standard in the test solution and in the reference solution, in milligrams,
- m_T = mass of α -tocopherol CRS in the reference solution, in milligrams,
- m = mass of the substance to be examined in the test solution, in milligrams.

STORAGE

Store in an airtight container, under an inert gas, protected from light.

01/2005:0691

α -TOCOPHEROL ACETATE CONCENTRATE (POWDER FORM)

α -Tocopheroli acetatis pulvis

DEFINITION

α -Tocopherol acetate concentrate (powder form) is prepared either by finely dispersing α -Tocopherol acetate (0439) in a suitable carrier of suitable quality (for example gelatin, acacia, carbohydrates, lactoproteins or a mixture thereof) or by adsorbing α -Tocopherol acetate (0439) on silicic acid of suitable quality.

The declared content of α -tocopherol acetate is not less than 25 g per 100 g of concentrate. The concentrate contains not less than 90.0 per cent and not more than 115.0 per cent of the content stated on the label.

CHARACTERS

Almost white, yellowish or light-brown small particles which, depending on their formulation, may be practically insoluble in water or may swell or form a dispersion.

IDENTIFICATION

Examine by thin-layer chromatography (2.2.27), using silica gel HF₂₅₄ *R* as the coating substance.

Test solution. To a quantity of concentrate corresponding to 50 mg of α -tocopherol acetate add 5 ml of 0.01 *M* hydrochloric acid and treat with ultrasound at 60 °C. Add 5 ml of ethanol *R* and 10 ml of cyclohexane *R*, shake for 1 min and centrifuge for 5 min. Use the upper layer.

Reference solution. Dissolve 50 mg of α -tocopherol acetate CRS in cyclohexane R and dilute to 10 ml with the same solvent.

Apply separately to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of ether R and 80 volumes of cyclohexane R. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

ASSAY

Examine by gas chromatography (2.2.28), using dotriacontane R as the internal standard.

Internal standard solution. Dissolve 0.20 g of dotriacontane R in hexane R and dilute to 100.0 ml with the same solvent.

Test solution. Weigh accurately a quantity of the preparation to be examined corresponding to about 0.100 g of α -tocopherol acetate in a 250 ml conical flask. Add 20 ml of 1 M hydrochloric acid and treat with ultrasound at 70 °C for 20 min. Add 50 ml of ethanol R and 50.0 ml of the internal standard solution and thoroughly mix the two phases for 30 min. Allow to separate, and use the upper layer.

Reference solution. Dissolve 0.100 g of α -tocopherol acetate CRS in the internal standard solution and dilute to 50.0 ml with the internal standard solution.

The chromatographic procedure may be carried out using:

- a silanised glass column 2.0 m to 3.0 m long and 2.2 mm to 4.0 mm in internal diameter packed with *diatomaceous earth for gas chromatography* R (125 μ m to 150 μ m or 150 μ m to 180 μ m), silanised with dimethyldichlorosilane and impregnated with 1 per cent *m/m* to 5 per cent *m/m* of *poly(dimethyl)siloxane* R; a plug of silanised glass wool is placed at each end of the column,
- *nitrogen for chromatography* R as the carrier gas at a flow rate of 25-90 ml/min,
- a flame-ionisation detector,

maintaining the column at a constant temperature between 245 °C and 280 °C and the injection port and the detector each at a constant temperature between 270 °C and 320 °C. Set the temperature of the column and the flow rate of the carrier gas in such a manner that the required resolution is achieved.

Make the injections directly onto the column or via an injection port (preferably glass-lined) using an automatic injection device or some other reproducible injection method. Measure the peak areas by electronic integration.

Resolution. Inject 1 μ l of the reference solution. Repeat this operation until the response factor (RF) determined as described below is constant to within ± 2 per cent. The resolution (R_s) between the dotriacontane peak and the α -tocopherol acetate peak is at least 1.4.

Interference test. Weigh accurately a quantity of the substance to be examined corresponding to about 0.100 g of α -tocopherol acetate in a 250 ml conical flask. Add 20 ml of 1 M hydrochloric acid and treat with ultrasound at 70 °C for 20 min. Add 50 ml of ethanol R and 50 ml of hexane R and thoroughly mix the two phases for 30 min. Allow to separate. Inject 1 μ l of the upper layer and record the chromatogram, choosing an attenuation such that the height of the peak corresponding to α -tocopherol acetate is greater than 50 per cent of the maximum recorder response; during the recording, change the attenuation so that any peak appearing with the same t_R value as for dotriacontane

is recorded with a sensitivity at least eight times greater than for the α -tocopherol acetate peak. If a peak with a height of at least 5 mm for a recorder paper width of 250 mm is detected with the same t_R value as for dotriacontane, use the corrected peak area $S'_{D(\text{corr.})}$ for the final calculation.

$$S'_{D(\text{corr.})} = S'_D - \frac{S_I \times S'_T}{f \times S_{TI}}$$

S'_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,

S_I = area of the interfering peak (same t_R value as that of the internal standard) in the chromatogram obtained in the interference test,

S'_T = area of the peak corresponding to α -tocopherol acetate in the chromatogram obtained with the test solution,

S_{TI} = area of the peak corresponding to α -tocopherol acetate in the chromatogram obtained in the interference test,

f = factor by which the attenuation was changed.

Inject 1 μ l of the reference solution and record the chromatogram, choosing an attenuation such that the peak corresponding to α -tocopherol acetate is greater than 50 per cent of the maximum recorder response. Measure the areas of the peaks corresponding to α -tocopherol acetate (S_T) and to dotriacontane (S_D) and determine the response factor (RF) as described below. Inject 1 μ l of the test solution in the same manner. Measure the areas of the peaks corresponding to α -tocopherol acetate (S'_T) and to dotriacontane (S'_D).

Determine the response factor (RF) for α -tocopherol acetate in the chromatogram obtained with the reference solution from the areas of the peak corresponding to α -tocopherol acetate and the peak corresponding to dotriacontane using the expression:

$$\frac{S_D \times m_T}{S_T \times m_D}$$

Calculate the percentage content of α -tocopherol acetate using the expression:

$$\frac{100 \times S'_T \times m_D \times \text{RF}}{S'_{D(\text{corr.})} \times m}$$

S_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the reference solution,

$S'_{D(\text{corr.})}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,

S_T = area of the peak corresponding to α -tocopherol acetate CRS in the chromatogram obtained with the reference solution,

S'_T = area of the peak corresponding to α -tocopherol acetate in the chromatogram obtained with the test solution,

m_D = mass of the internal standard in the test solution and in the reference solution in milligrams,

m_T = mass of α -tocopherol acetate CRS in the reference solution in milligrams,

m = mass of the substance to be examined in the test solution in milligrams.

STORAGE

Store in an airtight, well-filled container, protected from light.

LABELLING

The label states the content of α -tocopherol acetate, expressed in grams per 100 g of concentrate.

01/2005:0439

all-*rac*- α -TOCOPHERYL ACETATEint-*rac*- α -Tocopherylis acetas $C_{31}H_{52}O_3$ M_r 472.7

DEFINITION

all-*rac*-2,5,7,8-Tetramethyl-2-(4,8,12-trimethyltridecyl)-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate.

Content: 96.5 per cent to 101.0 per cent.

CHARACTERS

Appearance: clear, colourless or slightly greenish-yellow, viscous, oily liquid.

Solubility: practically insoluble in water, freely soluble in acetone, in ethanol and in fatty oils.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. Optical rotation (2.2.7): -0.01° to $+0.01^\circ$.

Dissolve 2.50 g in *ethanol R* and dilute to 25.0 ml with the same solvent.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: α -tocopheryl acetate CRS.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve about 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Reference solution. Dissolve about 10 mg of α -tocopheryl acetate CRS in 2 ml of *cyclohexane R*.

Plate: TLC silica gel F_{254} plate *R*.

Mobile phase: *ether R*, *cyclohexane R* (20:80 V/V).

Application: 10 μ l.

Development: over 2/3 of the plate.

Drying: in a current of air.

Detection: examine in ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Internal standard solution. Dissolve 1.0 g of *squalane R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Test solution (a). Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution.

Test solution (b). Dissolve 0.100 g of the substance to be examined in 10 ml of *cyclohexane R*.

Reference solution (a). Dissolve 0.100 g of α -tocopheryl acetate CRS in 10.0 ml of the internal standard solution.

Reference solution (b). Dissolve 10 mg of the substance to be examined and 10 mg of α -tocopherol *R* in *cyclohexane R* and dilute to 100.0 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of all-*rac*- α -tocopheryl acetate for peak identification CRS in *cyclohexane R* and dilute to 1 ml with the same solvent.

Reference solution (d). Dilute 1.0 ml of test solution (b) to 100.0 ml with *cyclohexane R*. Dilute 1.0 ml of this solution to 10.0 ml with *cyclohexane R*.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.25$ mm,
- **stationary phase:** poly(dimethyl)siloxane *R* (film thickness 0.25 μ m).

Carrier gas: helium for chromatography *R*.

Flow rate: 1 ml/min.

Split ratio: 1:100.

Temperature:

- **column:** 280 $^\circ$ C,
- **injection port and detector:** 290 $^\circ$ C.

Detection: flame ionisation.

Injection: 1 μ l of test solution (b) and reference solutions (a), (b), (c) and (d).

Run time: twice the retention time of all-*rac*- α -tocopheryl acetate.

Relative retention with reference to all-*rac*- α -tocopheryl acetate (retention time = about 15 min): squalane = about 0.4; impurity A = about 0.7; impurity B = about 0.8; impurity C = about 0.9; use the chromatogram supplied with the CRS to identify the peaks due to impurities A and B in the chromatogram obtained with reference solution (c).

System suitability:

- **resolution:** minimum 3.5 between the peaks due to impurity C and all-*rac*- α -tocopheryl acetate in the chromatogram obtained with reference solution (b),
- in the chromatogram obtained with reference solution (a), the area of the peak due to impurity C is not greater than 0.2 per cent of the area of the peak due to all-*rac*- α -tocopheryl acetate.

Limits:

- **impurities A, C:** for each impurity, maximum 0.5 per cent,
- **impurity B:** maximum 1.5 per cent,
- **any other impurity:** for each impurity, maximum 0.25 per cent,
- **total:** maximum 2.5 per cent,
- **disregard limit:** the area of the principal peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

ASSAY

Gas chromatography (2.2.28) as described in the test for related substances with the following modification.

Injection: test solution (a) and reference solution (a).

Calculate the percentage content of $C_{31}H_{52}O_3$ taking into account the declared content of α -tocopheryl acetate CRS.

STORAGE

Protected from light.

IMPURITIES

Specified impurities: A, B, C.

- A. all-*rac-trans*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate,

- B. all-*rac-cis*-2,3,4,6,7-pentamethyl-2-(4,8,12-trimethyltridecyl)-2,3-dihydrobenzofuran-5-yl acetate,
C. all-*rac*- α -tocopherol.

01/2005:1257

RRR- α -TOCOPHERYL ACETATE*RRR- α -Tocopherylis acetas*C₃₁H₅₂O₃M_r 472.7

DEFINITION

RRR- α -Tocopheryl acetate contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of (2*R*)-2,5,7,8-tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl acetate.

CHARACTERS

A clear, pale greenish-yellow, viscous, oily liquid, practically insoluble in water, freely soluble in acetone, in ethanol and in fatty oils, soluble in alcohol.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. It complies with the test for absorbance (see Tests).
B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with α -tocopheryl acetate CRS.
C. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel F₂₅₄ plate R.

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of cyclohexane R.

Test solution (b). In a ground glass-stoppered tube, dissolve 10 mg of the substance to be examined in 2 ml of 2.5 M alcoholic sulphuric acid R. Heat on a water-bath for 5 min. Cool and add 2 ml of water R and 2 ml of cyclohexane R. Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of α -tocopheryl acetate CRS in 2 ml of cyclohexane R.

Reference solution (b). Prepare as described for test solution (b), using α -tocopheryl acetate CRS instead of the substance to be examined.

Apply separately to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of ether R and 80 volumes of cyclohexane R. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there are two spots: the spot with the higher *R_f* value is due to α -tocopheryl acetate and corresponds to the spot in the chromatogram obtained with reference solution (a); the spot with the lower *R_f* value is due to α -tocopherol. Spray the plate with a mixture of 10 volumes of hydrochloric acid R, 40 volumes of a 2.5 g/l solution of ferric chloride R in alcohol R and 40 volumes of a 10 g/l solution of phenanthroline hydrochloride R in alcohol R. In the chromatograms obtained with test solution (b) and reference solution (b), the spot due to α -tocopherol is orange.

- D. After saponification, the resulting RRR- α -tocopherol is dextrorotatory (2.2.7). The specific optical rotation after oxidation to the quinone form is at least + 24.

Carry out the test avoiding exposure to actinic light. Transfer 1.0 g of the substance to be examined to a 250 ml round-bottomed flask with a ground-glass stopper; dissolve in 30 ml of ethanol R and heat under reflux for 3 min. While the solution is boiling, add, through the condenser, 20 ml of 2 M alcoholic potassium hydroxide solution R. Continue heating under reflux for 20 min and, without cooling, add 4.0 ml of hydrochloric acid R dropwise through the condenser. Cool, rinse the condenser with 10 ml of ethanol R, transfer the contents of the flask to a 500 ml separating funnel. Rinse the flask with four quantities, each of 25 ml, of water R and four quantities, each of 25 ml, of ether R. Add the rinsings to the separating funnel. Shake vigorously for 2 min, allow the layers to separate and collect each of the two layers in individual separating funnels. Shake the aqueous layer with two quantities, each of 50 ml, of ether R and add these extracts to the main ether extract. Wash the combined ether extracts with four quantities, each of 100 ml, of water R and discard the washings.

To the ether solution add 40 ml of a 100 g/l solution of potassium ferricyanide R in an 8 g/l solution of sodium hydroxide R and shake for 3 min. Wash the ether solution with four quantities, each of 50 ml, of water R, discard the washings and dry the ether layer over anhydrous sodium sulphate R. Evaporate the ether on a water-bath under reduced pressure or in an atmosphere of nitrogen until a few millilitres remain, then complete the evaporation removing the last traces of ether without the application of heat. Immediately dissolve the residue in 25.0 ml of trimethylpentane R and determine the optical rotation.

Calculate the specific optical rotation of the substance in the test solution using as c the number of grams equivalent to RRR- α -tocopherol (factor 0.911) in 1000 ml.

TESTS

Absorbance (2.2.25). Dissolve 0.150 g in *ethanol R* and dilute to 100 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol R* (solution A). Dilute 20.0 ml of the initial solution to 50.0 ml with *ethanol R* (solution B). Measure the absorbance of solution A at the maximum at 284 nm and the absorbance of solution B at the minimum at 254 nm. The specific absorbance at the maximum is 42.0 to 45.0 and that at the minimum is 7.0 to 9.0.

Acid value (2.5.1). Not more than 2.0, determined on 2.00 g.

Free tocopherol. Not more than 1.0 per cent. Dissolve 0.500 g in 100 ml of 0.25 M *alcoholic sulphuric acid R*. Add 20 ml of *water R* and 0.1 ml of a 2.5 g/l solution of *diphenylamine R* in *sulphuric acid R*. Titrate with 0.01 M *ammonium and cerium sulphate* until a blue colour is obtained which persists for at least 5 s. Carry out a blank titration.

1 ml of 0.01 M *ammonium and cerium sulphate* is equivalent to 2.154 mg of free tocopherol.

Heavy metals (2.4.8). 0.5 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g. Use *sulphuric acid R* instead of *dilute sulphuric acid R*.

ASSAY

Examine by gas chromatography (2.2.28), using *dotriacontane R* as the internal standard.

Internal standard solution. Dissolve 0.300 g of *dotriacontane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Dissolve 0.100 g of the substance to be examined in 10.0 ml of the internal standard solution, dilute to 50.0 ml with *hexane R* and mix.

Reference solution. Dissolve 0.100 g of α -tocopheryl acetate CRS in 10.0 ml of the internal standard solution, dilute to 50.0 ml with *hexane R* and mix.

The chromatographic procedure may be carried out using:

- a fused-silica column 15 m long and 0.32 mm in internal diameter coated with a 0.25 μ m layer of *poly(dimethyl)siloxane R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 3 ml/min to 6 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the injection port at 300 °C and that of the detector at 330 °C. Adjust the split ratio between 1 to 10 and 1 to 20. Set the temperature of the column at 200 °C, then raise the temperature at a rate of 5 °C per minute to 250 °C and maintain at 250 °C for 10 min.

Inject directly onto the column or via a glass-lined injection port using an automatic injection device or some other reproducible injection method. Measure the peak areas by electronic integration. The test is not valid unless: in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to dotriacontane and α -tocopheryl acetate is at least 4.0.

Interference test. Dissolve 0.100 g of the substance to be examined in *hexane R* and dilute to 50.0 ml with the same solvent. Inject 1 μ l of the solution and record the

chromatogram. If a peak is detected with the same t_R value as for dotriacontane, calculate the area of this peak relative to the peak area of α -tocopheryl acetate. If the relative peak area is greater than 0.5 per cent, use the corrected peak area $S'_{D(\text{corr})}$ for the final calculation.

$$S'_{D(\text{corr})} = S'_D - \frac{S_I \times S'_T}{S_{TI}}$$

S'_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,

S_I = area of the interfering peak (same t_R value as that of the internal standard) in the chromatogram obtained in the interference test,

S'_T = area of the peak corresponding to α -tocopheryl acetate in the chromatogram obtained with the test solution,

S_{TI} = area of the peak corresponding to α -tocopheryl acetate in the chromatogram obtained in the interference test.

After the system suitability has been established, inject 1 μ l of the reference solution and record the chromatogram. Measure the areas of the peaks corresponding to α -tocopheryl acetate (S_T) and dotriacontane (S_D) and determine the response factor (RF) as described below.

Determine the response factor (RF) for α -tocopheryl acetate in the chromatogram obtained with the reference solution from the areas of the peak corresponding to α -tocopheryl acetate and the peak corresponding to dotriacontane using the expression:

$$\text{RF} = \frac{S_D \times m_T}{S_T \times m_D}$$

Inject 1 μ l of the test solution in the same manner. Measure the areas of the peaks corresponding to α -tocopheryl acetate (S'_T) and dotriacontane (S'_D).

Calculate the percentage content of RRR- α -tocopheryl acetate using the expression:

$$\frac{100 (S'_T \times m_D \times \text{RF})}{S'_{D(\text{corr})} \times m}$$

S_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the reference solution,

$S'_{D(\text{corr})}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,

S_T = area of the peak corresponding to α -tocopheryl acetate CRS in the chromatogram obtained with the reference solution,

S'_T = area of the peak corresponding to α -tocopheryl acetate in the chromatogram obtained with the test solution,

m_D = mass of the internal standard in the test solution and in the reference solution, in milligrams,

m_T = mass of α -tocopheryl acetate CRS in the reference solution, in milligrams,

m = mass of the substance to be examined in the test solution, in milligrams.

STORAGE

Store protected from light.

corrected**DL- α -TOCOPHERYL HYDROGEN
SUCCINATE**DL- α -Tocopherylis hydrogenosuccinas $C_{33}H_{54}O_5$ M_r 530.8**DEFINITION**

DL- α -Tocopheryl hydrogen succinate contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of (2*RS*)-2,5,7,8-tetramethyl-2-[(4*RS*,8*RS*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl hydrogen succinate.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in acetone and in ethanol, very soluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. It complies with the test for absorbance (see Tests).
 B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *RRR- α -tocopheryl hydrogen succinate CRS*.
 C. Examine by thin-layer chromatography (2.2.27), using silica gel HF_{254} *R* as the coating substance.

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Test solution (b). In a ground glass-stoppered tube, dissolve 10 mg of the substance to be examined in 2 ml of 2.5 *M* alcoholic sulphuric acid *R*. Heat on a water-bath for 5 min. Cool and add 2 ml of *water R* and 2 ml of *cyclohexane R*. Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of *RRR- α -tocopheryl hydrogen succinate CRS* in 2 ml of *cyclohexane R*.

Reference solution (b). Prepare as described for test solution (b), using *RRR- α -tocopheryl hydrogen succinate CRS* instead of the substance to be examined.

Apply to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 0.2 volumes of *glacial acetic acid R*, 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with the reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there are two spots: the spot with the higher R_f value is due to α -tocopherol, the spot with the lower R_f value is due to α -tocopheryl acid succinate and corresponds to the spot obtained with reference

solution (a). Depending on the degree of hydrolysis, the lower spot may be weak or even absent. Spray the plate with a mixture of 10 volumes of *hydrochloric acid R*, 40 volumes of a 2.5 g/l solution of *ferric chloride R* in *alcohol R* and 40 volumes of a 10 g/l solution of *phenanthroline hydrochloride R* in *alcohol R*. In the chromatograms obtained with test solution (b) and reference solution (b), the spot due to α -tocopherol is orange.

D. It complies with the test for optical rotation (see Tests).

TESTS

Optical rotation (2.2.7). Dissolve 2.50 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The angle of optical rotation is -0.01° to $+0.01^\circ$.

Absorbance (2.2.25). Dissolve 0.150 g in *ethanol R* and dilute to 100 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol R* (solution a). Dilute 20.0 ml of the initial solution to 50.0 ml with *ethanol R* (solution b). Measure the absorbance of solution (a) at the maximum at 284 nm and the absorbance of solution (b) at the minimum at 254 nm. The specific absorbance at the maximum is 35 to 38 and that at the minimum is 6.0 to 8.0.

Acid value (2.5.1). Between 101 and 108, determined on 1.00 g.

Free tocopherol. Not more than 1.0 per cent. Dissolve 0.500 g in 100 ml of 0.25 *M* alcoholic sulphuric acid *R*. Add 20 ml of *water R* and 0.1 ml of a 2.5 g/l solution of *diphenylamine R* in *sulphuric acid R*. Titrate with 0.01 *M* ammonium and cerium sulphate until a blue colour is obtained which persists for at least 5 s. Carry out a blank titration.

1 ml of 0.01 *M* ammonium and cerium sulphate is equivalent to 2.154 mg of free tocopherol.

Heavy metals (2.4.8). 0.50 g complies with limit test D for heavy metals (20 ppm). Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g. Use *sulphuric acid R* instead of *dilute sulphuric acid R*.

ASSAY

Examine by gas chromatography (2.2.28), using *dotriacontane R* as the internal standard.

Internal standard solution. Dissolve 0.300 g of *dotriacontane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Weigh 30.0 mg of the substance to be examined into a 20 ml vial. Pipette 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R* into the vial. Cap tightly and sonicate the sample. Allow to stand in the dark for 1 h ($\pm$ 5 min). Remove the sample from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Pipette 10.0 ml of the internal standard solution into the sample vial. Vortex into solution.

Reference solution. Weigh 30.0 mg of *RRR- α -tocopheryl hydrogen succinate CRS* into a 20 ml vial, weigh to the nearest 0.01 mg. Pipette 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R* into the vial. Cap tightly and sonicate the reference solution. Allow to stand in the dark for 1 h ($\pm$ 5 min). Remove the reference solution from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Pipette 10.0 ml of the internal standard solution into the reference solution vial. Vortex into solution.

The chromatographic procedure may be carried out using:

- a fused-silica open tubular capillary column 15 m long and 0.32 mm in internal diameter coated with a 0.25 µm layer of *poly(dimethyl)siloxane R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 3 ml/min to 6 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the injection port at 300 °C and that of the detector at 330 °C. Adjust the split ratio between 1 to 10 and 1 to 20. Set the temperature of the column at 200 °C, then raise the temperature at a rate of 5 °C per min to 250 °C and maintain at 250 °C for 10 min.

Inject directly onto the column or via a glass-lined injection port using an automatic injection device or some other reproducible injection method. Measure the peak areas by electronic integration. The test is not valid unless: in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to dotriacontane and α-tocopheryl hydrogen succinate is at least 12.0.

Interference test. Dissolve 0.100 g of the substance to be examined in *hexane R* and dilute to 50.0 ml with the same solvent. Inject 1 µl of the solution and record the chromatogram. If a peak is detected with the same t_R value as for dotriacontane, calculate the area of this peak relative to the peak area of the substance to be examined. If the relative peak area is greater than 0.5 per cent, use the corrected peak area $S'_{D(\text{corr})}$ for the final calculation.

$$S'_{D(\text{corr})} = S'_D - \frac{S_I \times S'_T}{S_{TI}}$$

- S'_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,
- S_I = area of the interfering peak (same t_R value as that of the internal standard) in the chromatogram obtained in the interference test,
- S'_T = area of the peak corresponding to α-tocopheryl hydrogen succinate in the chromatogram obtained with the test solution,
- S_{TI} = area of the peak corresponding to α-tocopheryl hydrogen succinate in the chromatogram obtained in the interference test.

After the system suitability has been established, inject 1 µl of the reference solution and record the chromatogram. Measure the areas of the peaks corresponding to α-tocopheryl hydrogen succinate (S_T) and dotriacontane (S_D) and determine the response factor (RF) as described below.

Determine the response factor (RF) for α-tocopheryl hydrogen succinate in the chromatogram obtained with the reference solution from the area of the peak corresponding to α-tocopheryl hydrogen succinate and the peak corresponding to dotriacontane using the expression:

$$\text{RF} = \frac{S_D \times m_T}{S_T \times m_D}$$

Inject 1 µl of the test solution in the same manner. Measure the areas of the peaks corresponding to α-tocopheryl hydrogen succinate (S'_T) and dotriacontane (S'_D).

Calculate the percentage content of α-tocopheryl acid succinate using the expression:

$$\frac{100 (S'_T \times m_D \times \text{RF})}{S'_{D(\text{corr})} \times m}$$

- S_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the reference solution,
- $S'_{D(\text{corr})}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,
- S_T = area of the peak corresponding to *RRR-α-tocopheryl hydrogen succinate CRS* in the chromatogram obtained with the reference solution,
- S'_T = area of the peak corresponding to *DL-α-tocopheryl hydrogen succinate* in the chromatogram obtained with the test solution,
- m_D = mass of the internal standard in the test solution and in the reference solution in milligrams,
- m_T = mass of *RRR-α-tocopheryl hydrogen succinate CRS* in the reference solution, in milligrams,
- m = mass of the substance to be examined in the test solution, in milligrams.

STORAGE

Store protected from light.

corrected

RRR-α-TOCOPHERYL HYDROGEN SUCCINATE

RRR-α-Tocopherylis hydrogenosuccinas

$C_{33}H_{54}O_5$

M_r 530.8

DEFINITION

RRR-α-Tocopheryl hydrogen succinate contains not less than 96.0 per cent and not more than the equivalent of 102.0 per cent of (2*R*)-2,5,7,8-tetramethyl-2-[(4*R*,8*R*)-4,8,12-trimethyltridecyl]-3,4-dihydro-2*H*-1-benzopyran-6-yl hydrogen succinate.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, soluble in acetone and in ethanol, very soluble in methylene chloride.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- It complies with the test for absorbance (see Tests).
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *RRR-α-tocopheryl hydrogen succinate CRS*.
- Examine by thin-layer chromatography (2.2.27), using *silica gel HF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 10 mg of the substance to be examined in 2 ml of *cyclohexane R*.

Test solution (b). In a ground-glass-stoppered tube, dissolve 10 mg of the substance to be examined in 2 ml of *2.5 M alcoholic sulphuric acid R*. Heat on a water-bath for 5 min. Cool and add 2 ml of *water R* and 2 ml of *cyclohexane R*. Shake for 1 min. Use the upper layer.

Reference solution (a). Dissolve 10 mg of *RRR- α -tocopheryl hydrogen succinate CRS* in 2 ml of *cyclohexane R*.

Reference solution (b). Prepare as described for test solution (b), using *RRR- α -tocopheryl hydrogen succinate CRS* instead of the substance to be examined.

Apply separately to the plate 10 μ l of each solution. Develop over a path of 15 cm using a mixture of 0.2 volumes of *glacial acetic acid R*, 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Dry the plate in a current of air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with test solution (a) is similar in position and size to the principal spot in the chromatogram obtained with the reference solution (a). In the chromatograms obtained with test solution (b) and reference solution (b), there are two spots: the spot with the higher R_f value is due to α -tocopherol, the spot with the lower R_f value is due to α -tocopheryl hydrogen succinate and corresponds to the spot obtained with reference solution (a). Depending on the degree of hydrolysis, the lower spot may be weak or even absent. Spray the plate with a mixture of 10 volumes of *hydrochloric acid R*, 40 volumes of a 2.5 g/l solution of *ferric chloride R* in *alcohol R* and 40 volumes of a 10 g/l solution of *phenanthroline hydrochloride R* in *alcohol R*. In the chromatograms obtained with test solution (b) and reference solution (b), the spot due to α -tocopherol is orange.

- D. After saponification, the resulting *RRR- α -tocopherol* is dextrorotatory (2.2.7). The specific optical rotation after oxidation to the quinone form is at least + 24.

Carry out the test avoiding exposure to actinic light. Transfer 1.0 g of the substance to be examined to a round bottomed, ground-glass-stoppered, 250 ml flask and dissolve in 30 ml of *ethanol R* and heat under reflux for 3 min. While the solution is boiling, add, through the condenser, 20 ml of *2 M alcoholic potassium hydroxide solution R*. Continue heating under reflux for 20 min and, without cooling, add 4.0 ml of *hydrochloric acid R* dropwise through the condenser. Cool, rinse the condenser with 10 ml of *ethanol R*, transfer the contents of the flask to a 500 ml separating funnel, rinse the flask with four quantities, each of 25 ml, of *water R* and four quantities, each of 25 ml, of *ether R*. Add the rinsings to the separating funnel. Shake vigorously for 2 min, allow the layers to separate and collect each of the two layers in individual separating funnels. Shake the aqueous layer with two quantities, each of 50 ml, of *ether R* and add these extracts to the main ether extract. Wash the combined ether extracts with four quantities, each of 100 ml, of *water R* and discard the washings.

To the ether solution add 40 ml of a 100 g/l solution of *potassium ferricyanide R* in an 8 g/l solution of *sodium hydroxide R* and shake for 3 min. Wash the ether solution with four quantities, each of 50 ml, of *water R*, discard the washings and dry the ether layer over *anhydrous sodium sulphate R*. Evaporate the ether on a water-bath under reduced pressure or in an atmosphere of nitrogen until a few millilitres remain, then complete the evaporation

removing the last traces of ether without the application of heat. Immediately dissolve the residue in 25.0 ml of *trimethylpentane R* and determine the optical rotation.

Calculate the specific optical rotation of the substance in the test solution using as c the number of grams equivalent to α -tocopherol (factor 0.811) in 1000 ml.

TESTS

Absorbance (2.2.25). Dissolve 0.150 g in *ethanol R* and dilute to 100 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *ethanol R* (solution a). Dilute 20.0 ml of the initial solution to 50.0 ml with *ethanol R* (solution b). Measure the absorbance of solution (a) at the maximum at 284 nm and the absorbance of solution (b) at the minimum at 254 nm. The specific absorbance at the maximum is 35 to 38 and that at the minimum is 6.0 to 8.0.

Acid value (2.5.1). Between 101 and 108, determined on 1.00 g.

Free tocopherol. Not more than 1.0 per cent. Dissolve 0.500 g in 100 ml of *0.25 M alcoholic sulphuric acid R*. Add 20 ml of *water R* and 0.1 ml of a 2.5 g/l solution of *diphenylamine R* in *sulphuric acid R*. Titrate with *0.01 M ammonium and cerium sulphate* until a blue colour is obtained which persists for at least 5 s. Carry out a blank titration.

1 ml of *0.01 M ammonium and cerium sulphate* is equivalent to 2.154 mg of free tocopherol.

Heavy metals (2.4.8). 0.50 g complies with limit test D for heavy metals (20 ppm). Prepare the reference solution using 1 ml of *lead standard solution (10 ppm Pb) R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g. Use *sulphuric acid R* instead of *dilute sulphuric acid R*.

ASSAY

Examine by gas chromatography (2.2.28), using *dotriacontane R* as the internal standard.

Internal standard solution. Dissolve 0.300 g of *dotriacontane R* in *hexane R* and dilute to 100.0 ml with the same solvent.

Test solution. Weigh 30.0 mg of the substance to be examined into a 20 ml vial. Pipette 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R* into the vial. Cap tightly and sonicate the sample. Allow to stand in the dark for 1 h ($\pm$ 5 min). Remove the sample from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Pipette 10.0 ml of the internal standard solution into the sample vial. Vortex into solution.

Reference solution. Weigh 30.0 mg of *RRR- α -tocopheryl hydrogen succinate CRS* into a 20 ml vial. Pipette 2.0 ml of *methanol R*, 1.0 ml of *dimethoxypropane R* and 0.1 ml of *hydrochloric acid R* into the vial. Cap tightly and sonicate the reference solution. Allow to stand in the dark for 1 h ($\pm$ 5 min). Remove the reference solution from the dark, uncap and evaporate just to dryness on a steam bath with the aid of a stream of nitrogen. Pipette 10.0 ml of the internal standard solution into the reference solution vial. Vortex into solution.

The chromatographic procedure may be carried out using:

- a fused-silica open tubular capillary column 15 m long and 0.32 mm in internal diameter coated with a 0.25 μ m layer of *poly(dimethyl)siloxane R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 3 ml/min to 6 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the injection port at 300 °C and that of the detector at 330 °C. Adjust the split ratio between 1 to 10 and 1 to 20. Set the temperature of the column at 200 °C, then raise the temperature at a rate of 5 °C per min to 250 °C and maintain at 250 °C for 10 min.

Inject directly onto the column or via a glass-lined injection port using an automatic injection device or some other reproducible injection method. Measure the peak areas by electronic integration. The test is not valid unless: in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to dotriacontane and α -tocopheryl hydrogen succinate is at least 12.0.

Interference test. Dissolve 0.100 g of the solution to be examined in *hexane R* and dilute to 50.0 ml with the same solvent. Inject 1 μ l of the solution and record the chromatogram. If a peak is detected with the same t_R value as for dotriacontane, calculate the area of this peak relative to the peak area of α -tocopheryl succinate. If the relative peak area is greater than 0.5 per cent, use the corrected peak area $S'_{D(\text{corr})}$ for the final calculation.

$$S'_{D(\text{corr})} = S'_D - \frac{S_I \times S'_T}{S_{TI}}$$

S'_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,

S_I = area of the interfering peak (same t_R value as that of the internal standard) in the chromatogram obtained in the interference test,

S'_T = area of the peak corresponding to α -tocopheryl hydrogen succinate in the chromatogram obtained with the test solution,

S_{TI} = area of the peak corresponding to α -tocopheryl hydrogen succinate in the chromatogram obtained in the interference test.

After the system suitability has been established, inject 1 μ l of the reference solution and record the chromatogram. Measure the areas of the peaks corresponding to the α -tocopheryl hydrogen succinate (S_T) and dotriacontane (S_D) and determine the response factor (RF) as described below.

Determine the response factor (RF) for α -tocopheryl hydrogen succinate in the chromatogram obtained with the reference solution from the area of the peak corresponding to α -tocopheryl hydrogen succinate and the peak corresponding to dotriacontane using the expression:

$$\text{RF} = \frac{S_D \times m_T}{S_T \times m_D}$$

Inject 1 μ l of the test solution in the same manner. Measure the areas of the peaks corresponding to α -tocopheryl hydrogen succinate (S'_T) and dotriacontane (S'_D).

Calculate the percentage content of α -tocopheryl hydrogen succinate using the expression:

$$\frac{100 (S'_T \times m_D \times \text{RF})}{S'_{D(\text{corr})} \times m}$$

S_D = area of the peak corresponding to the internal standard in the chromatogram obtained with the reference solution,

$S'_{D(\text{corr})}$ = corrected area of the peak corresponding to the internal standard in the chromatogram obtained with the test solution,

S_T = area of the peak corresponding to *RRR*- α -tocopheryl hydrogen succinate CRS in the chromatogram obtained with the reference solution,

S'_T = area of the peak corresponding to α -tocopheryl hydrogen succinate in the chromatogram obtained with the test solution,

m_D = mass of the internal standard in the test solution and in the reference solution, in milligrams,

m_T = mass of *RRR*- α -tocopheryl hydrogen succinate CRS in the reference solution in milligrams,

m = mass of the substance to be examined in the test solution, in milligrams.

STORAGE

Store protected from light.

TOLBUTAMIDE

Tolbutamidum

$C_{12}H_{18}N_2O_3S$

M_r 270.3

DEFINITION

Tolbutamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 1-butyl-3-[(4-methylphenyl)sulfonyl]urea, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, practically insoluble in water, soluble in acetone and in alcohol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D.

A. Melting point (2.2.14): 126 °C to 130 °C.

B. Dissolve 25.0 mg in *methanol R* and dilute to 100.0 ml with the same solvent. Examined between 245 nm and 300 nm (2.2.25), the solution shows three absorption maxima, at 258 nm, 263 nm and 275 nm, and a shoulder at 268 nm. Dilute 10.0 ml of the solution to 250.0 ml with *methanol R*. Examined between 220 nm and 235 nm, the solution shows a single absorption maximum, at 228 nm. The specific absorbance at this maximum is 480 to 520.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tolbutamide CRS*.

D. To 0.2 g add 8 ml of a 500 g/l solution of *sulphuric acid R* and heat under a reflux condenser for 30 min. Allow to cool. Crystals are formed which, after recrystallisation from hot *water R* and drying at 100 °C to 105 °C, melt (2.2.14) at 135 °C to 140 °C.

TESTS

Appearance of solution. Dissolve 0.2 g in 5 ml of *dilute sodium hydroxide solution R* and add 5 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). To 2.0 g add 50 ml of *carbon dioxide-free water R* and heat at 70 °C for 5 min. Cool rapidly and filter. The pH of the filtrate is 4.5 to 5.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.50 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 15 mg of *toluenesulphonamide R* in *acetone R* and dilute to 100 ml with the same solvent.

Reference solution (b). To 5 ml of the test solution add 5 ml of reference solution (a).

Apply to the plate 5 µl of the test solution and of reference solution (a) and 10 µl of reference solution (b). Develop over a path of 15 cm using a mixture of 2 volumes of *anhydrous formic acid R*, 8 volumes of *methanol R* and 90 volumes of *chloroform R*. Dry the plate in a current of warm air and heat at 110 °C for 10 min. At the bottom of a chromatography tank, place an evaporating dish containing a 50 g/l solution of *potassium permanganate R* and add an equal volume of *hydrochloric acid R*. Place the plate whilst still hot in the tank and close the tank. Leave the plate in contact with the chlorine vapour for 2 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of coating below the points of application gives at most a very faint blue colour with a drop of *potassium iodide and starch solution R*; avoid prolonged exposure to cold air. Spray with *potassium iodide and starch solution R* and allow to stand for 5 min. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.3 per cent). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

Heavy metals (2.4.8). Dissolve 1.0 g in a mixture of 15 volumes of *water R* and 85 volumes of *acetone R* and dilute to 20 ml with the same mixture of solvents. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 15 volumes of *water R* and 85 volumes of *acetone R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2500 g in a mixture of 20 ml of *water R* and 40 ml of *alcohol R*. Titrate with 0.1 M *sodium hydroxide*, using 1 ml of *phenolphthalein solution R* as indicator.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 27.03 mg of C₁₄H₁₂N₂O₃S.

TOLFENAMIC ACID

Acidum tolfenamicum

C₁₄H₁₂ClNO₂M_r 261.7

DEFINITION

2-[(3-Chloro-2-methylphenyl)amino]benzoic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellow, crystalline powder.

Solubility: practically insoluble in water, soluble in dimethylformamide, sparingly soluble in ethanol and in methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

mp: about 213 °C.

IDENTIFICATION

First identification: B.

Second identification: A, C.

A. Dissolve 20 mg in a mixture of 1 volume of 1 M *hydrochloric acid* and 99 volumes of *methanol R* and dilute to 100 ml with the same mixture of solvents. Dilute 5.0 ml of the solution to 50 ml with a mixture of 1 volume of 1 M *hydrochloric acid* and 99 volumes of *methanol R*. Examined between 250 nm and 380 nm (2.2.25), the solution shows 2 absorption maxima, at 286 nm and 345 nm. The ratio of the absorbance measured at the maximum at 286 nm to that measured at the maximum at 345 nm is 1.2 to 1.4.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: *tolfenamic acid CRS*.

C. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of 1 volume of *methanol R* and 3 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 25 mg of *tolfenamic acid CRS* in a mixture of 1 volume of *methanol R* and 3 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: TLC silica gel GF₂₅₄ plate R.

Mobile phase: *glacial acetic acid R*, *dioxan R*, *toluene R* (1:25:90 V/V/V).

Application: 10 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection: ultraviolet light at 254 nm.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in 5 ml of *ethanol R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of 2-chlorobenzoic acid *R* and 25 mg of 3-chloro-2-methylaniline *R* in 5 ml of ethanol *R* and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** spherical end-capped octadecylsilyl silica gel for chromatography *R* (5 μ m) with a specific surface area of 450 m²/g and a pore size of 8 nm.

Mobile phase: glacial acetic acid *R*, water *R*, ethanol *R* (2:350:650 V/V/V).

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 232 nm.

Injection: 20 μ l.

Run time: 3 times the retention time of tolafenamic acid.

Relative retention with reference to tolafenamic acid (retention time = about 15 min): impurity A = about 0.25; impurity B = about 0.34.

System suitability: reference solution (a):

- **resolution:** minimum 2.5 between the peaks due to impurity A and to impurity B.

Limits:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **impurity B:** not more than half the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.05 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.01 per cent).

Copper: maximum 10 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Place 1.00 g of the substance to be examined in a silica crucible, moisten with sulphuric acid *R*, heat cautiously on a flame for 30 min and then progressively to about 650 °C. Continue ignition until all black particles have disappeared. Allow to cool, dissolve the residue in 0.1 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Reference solutions. Prepare the reference solutions using copper standard solution (0.1 per cent Cu) *R*, diluted as necessary using 0.1 M nitric acid.

Source: copper hollow-cathode lamp.

Wavelength: 324.8 nm.

Flame: air-acetylene.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g with the aid of ultrasound in 100 ml of ethanol *R*. Add 0.1 ml of phenol red solution *R* and titrate with 0.1 M sodium hydroxide.

1 ml of 0.1 M sodium hydroxide is equivalent to 26.17 mg of C₁₄H₁₂ClNO₂.

STORAGE

Protected from light.

IMPURITIES

A. 2-chlorobenzoic acid,

B. 3-chloro-2-methylaniline,

C. 3-chloro-4-methyl-9-oxo-9,10-dihydroacridine.

01/2005:1158

TOLNAFTATE

Tolnaftatum

C₁₉H₁₇NOS

*M*_r 307.4

DEFINITION

Tolnaftate contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of *O*-naphthalen-2-yl methyl(3-methylphenyl)thiocarbamate, calculated with reference to the dried substance.

CHARACTERS

A white or yellowish-white powder, practically insoluble in water, freely soluble in acetone and in methylene chloride, very slightly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 109 °C to 112 °C.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with tolinaftate CRS. Examine the substances prepared as discs.

- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. Mix about 1 mg with 0.5 ml of *sulphuric acid R*. Add 0.05 ml of *formaldehyde solution R*. A greenish-blue colour develops.

D. *N*,3-dimethylaniline.

TESTS

Appearance of solution. Dissolve 0.5 g in 10 ml of *acetone R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *acetone R* and dilute to 2 ml with the same solvent.

Test solution (b). Dilute 0.5 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dissolve 25 mg of *tolnaftate CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *acetone R*.

Reference solution (c). Dissolve 50 mg of *β-naphthol R* in 1 ml of test solution (a) and dilute to 10 ml with *acetone R*. Apply separately to the plate 5 µl of each solution. Develop over a path of 12 cm using *toluene R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 50.0 mg in *methanol R* and dilute to 250.0 ml with the same solvent. Dilute 2.0 ml to 50.0 ml with *methanol R*. Measure the absorbance (2.2.25) at the maximum at 257 nm. Calculate the content of C₁₉H₁₇NOS taking the specific absorbance to be 720.

STORAGE

Store protected from light.

IMPURITIES

- A. R = H: naphthalen-2-ol (β-naphthol),
- C. R = CS-Cl: *O*-naphthalen-2-yl chlorothioformate,

- B. *O,O*-dinaphthalen-2-yl thiocarbonate,

TOLU BALSAM

Balsamum tolutanum

01/2005:1596

DEFINITION

Oleo-resin obtained from the trunk of *Myroxylon balsamum* (L.) Harms var. *balsamum*.

Content: 25.0 per cent to 50.0 per cent of free or combined acids, expressed as cinnamic acid (C₉H₈O₂; *M_r* 148.2) (dried drug).

CHARACTERS

Appearance: hard, friable, brownish to reddish-brown mass; thin fragments are brownish-yellow when examined against the light.

Reminiscent odour of vanillin.

Solubility: practically insoluble in water, very soluble to freely soluble in alcohol, practically insoluble in light petroleum.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. Stir 0.40 g of the fragmented drug with 10 ml of *methylene chloride R* for 5 min and filter.

Reference solution. Dissolve 50 mg of *benzyl cinnamate R* in *methylene chloride R*, add 50 µl of *benzyl benzoate R* and dilute to 10 ml with *methylene chloride R*.

Plate: *TLC silica gel G plate R*.

Mobile phase: *light petroleum R*, *toluene R* (5:95 V/V).

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *vanillin reagent R* and heat at 100–105 °C for 5 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the test and reference solutions. Furthermore, other coloured zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Benzyl benzoate: a greyish-blue zone	a greyish-blue zone
Benzyl cinnamate: a greyish-green zone	a greyish-green zone
Reference solution	Test solution

TESTS

Acid value: 100 to 160.

Dissolve 0.5 g of the fragmented drug in 50 ml of *alcohol R*. Add 0.5 ml of *acid blue 93 solution R* and 5.0 ml of 0.5 *M alcoholic potassium hydroxide*. Stir vigorously and titrate with 0.5 *M hydrochloric acid* until the colour changes from brownish-red to blackish-green (*n*₁ ml of 0.5 *M hydrochloric acid*). Carry out a blank test in the same manner (*n*₂ ml of 0.5 *M hydrochloric acid*). Calculate the acid value in the same manner as the saponification value (2.5.6).

Matter insoluble in alcohol: maximum 5 per cent.

Boil 2.0 g of the fragmented drug with 25 ml of *alcohol* (90 per cent V/V) *R* and filter. Wash the residue with *alcohol* (90 per cent V/V) *R*, boiling until completely extracted, then dry the residue at 100-105 °C. Weigh the residue.

Loss on drying (2.2.32): maximum 5.0 per cent, determined on 2.000 g of the fragmented drug by spreading on a flat evaporating dish 9 cm in diameter and allowing to dry *in vacuo* for 4 h.

Total ash (2.4.16): maximum 0.3 per cent.

ASSAY

Boil 1.500 g under a reflux condenser with 25 ml of 0.5 *M* *alcoholic potassium hydroxide* for 1 h. Evaporate the ethanol and heat the residue with 50 ml of *water R* until the substance is homogeneously distributed. After cooling, add 80 ml of *water R* and a solution of 1.5 g of *magnesium sulphate R* in 50 ml of *water R*. Mix, and allow to stand for 10 min. Filter through a pleated filter paper and wash the residue with 20 ml of *water R*. Combine the filtrate and the washings, acidify with *hydrochloric acid R* and extract with 4 quantities, each of 40 ml, of *ether R*. Discard the aqueous layer. Combine the organic extracts and wash with 2 quantities, each of 20 ml, and with 3 quantities, each of 10 ml, of a 50 g/l solution of *sodium bicarbonate R*. Discard the ether layer. Combine the aqueous extracts, acidify with *hydrochloric acid R* and stir once with 30 ml, twice with 20 ml and once with 10 ml of *methylene chloride R*. Dry the combined methylene chloride extracts over *anhydrous sodium sulphate R*. Filter through a pleated filter and wash the residue with 10 ml of *methylene chloride R*. Reduce the combined methylene chloride extracts to 10 ml by distillation and eliminate the remaining methylene chloride in a current of air. Dissolve the residue with heating in 10 ml of *alcohol R* previously neutralised to *phenol red solution R*. After cooling, titrate with 0.1 *M* *sodium hydroxide*, using the same indicator.

1 ml of 0.1 *M* *sodium hydroxide* is equivalent to 14.82 mg of total acids, expressed as cinnamic acid.

STORAGE

Do not store in powdered form.

01/2005:1478

TORMENTIL

Tormentillae rhizoma

DEFINITION

Whole or cut, dried rhizome, freed from the roots, of *Potentilla erecta* (L.) Raeusch. (*P. tormentilla* Stokes).

Content: minimum 7 per cent of tannins, expressed as pyrogallol (C₆ H₆ O₃; *M_r* 126.1) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The rhizome is cylindrically spindle-shaped, with a very irregular appearance, often forming, twisted, knotty tubers, up to 10 cm long and 1 cm to 2 cm thick, very hard and scarcely branched. The surface is brown to reddish-brown, rugose and has remains of roots and

transversely elongated depressed whitish scars from the stems. At the top of the rhizome the remains of numerous aerial stems may be present. The fracture is short and granular, dark red to brownish-yellow.

- B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: coarsely serrate cluster crystals of calcium oxalate, up to 60 µm in diameter; fragments of thin-walled parenchyma containing reddish-brown tannin; groups of narrow, bordered-pitted vessels with lateral pores; thick-walled and pitted, polygonal parenchyma; groups and fragments of sclerenchymatous thick-walled fibres; occasional fragments of cork with thin-walled, brown, tabular cells. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows spherical or elliptical starch granules, up to about 20 µm in length.
- C. Thin-layer chromatography (2.2.27).

Test solution. To 0.5 g of the powdered drug (355) add 10 ml of *water R*, shake for 10 min and filter. Shake the filtrate with 2 quantities, each of 10 ml, of *ethyl acetate R* and filter the combined upper phases over 6 g of *anhydrous sodium sulphate R*. Evaporate the filtrate to dryness under reduced pressure and dissolve the residue in 1.0 ml of *ethyl acetate R*.

Reference solution. Dissolve 1.0 mg of *catechin R* in 1.0 ml of *methanol R*.

Plate: TLC silica gel plate *R*.

Mobile phase: *glacial acetic acid R*, *ether R*, *hexane R*, *ethyl acetate R* (20:20:20:40 V/V/V/V).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air for 10-15 min.

Detection: spray with a freshly prepared 5 g/l solution of *fast blue B salt R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense turning reddish-brown. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other fainter zones are present in the chromatogram obtained with the test solution.

Top of the plate	
Catechin: an intense reddish-brown zone	A more intense reddish-brown zone (catechin)
	A fainter zone
	An intense zone
	Fainter zones
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 3 per cent of root and stems as well as rhizomes with black fracture and maximum 2 per cent of other foreign matter.

Loss on drying (2.8.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 5.0 per cent.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 0.500 g of the powdered drug (180).

01/2005:0381

TOSYLCHLORAMIDE SODIUM

Tosylchloramidum natricum

C₇H₇ClNNaO₂S·3H₂OM_r 281.7

TORMENTIL TINCTURE

Tormentillae tinctura

DEFINITION

Tincture produced from *Tormentil* (1478).

Content: minimum 1.5 per cent *m/m* of tannins, expressed as pyrogallol (C₆H₆O₃; M_r 126.1).

PRODUCTION

The tincture is produced from 1 part of comminuted drug and 5 parts of ethanol (70 per cent *V/V*) by a suitable procedure.

CHARACTERS

Red or reddish-brown liquid.

IDENTIFICATION

Thin-layer chromatography (2.2.27).

Test solution. Mix 1.0 ml of the tincture to be examined with 1.0 ml of alcohol (70 per cent *V/V*) *R*.

Reference solution. Dissolve 1.0 mg of catechin *R* in 1.0 ml of methanol *R*.

Plate: TLC silica gel plate *R*.

Mobile phase: ether *R*, glacial acetic acid *R*, hexane *R*, ethyl acetate *R* (20:20:20:40 *V/V/V/V*).

Application: 10 µl, as bands.

Development: over a path of 10 cm.

Drying: in air for 10-15 min.

Detection: spray with a freshly prepared 5 g/l solution of fast blue B salt *R*. Reddish zones appear. Expose the plate to ammonia vapour, the zones become more intense, turning reddish-brown. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Catechin: an intense zone	An intense zone (catechin)
	A fainter zone
	An intense zone
	Fainter zones
Reference solution	Test solution

TESTS

Ethanol content (2.9.10): 64 per cent *V/V* to 69 per cent *V/V*.

Methanol and 2-propanol (2.9.11): maximum 0.05 per cent *V/V* of methanol and maximum 0.05 per cent *V/V* of 2-propanol.

ASSAY

Carry out the determination of tannins in herbal drugs (2.8.14). Use 2.50 g of the tincture to be examined.

DEFINITION

Tosylchloramide sodium contains not less than 98.0 per cent and not more than the equivalent of 103.0 per cent of sodium *N*-chloro-4-methylbenzene-sulphonimide trihydrate.

CHARACTERS

A white or slightly yellow, crystalline powder, freely soluble in water, soluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) turns red litmus paper *R* blue and then bleaches it.
- To 10 ml of solution S add 10 ml of dilute hydrogen peroxide solution *R*. A white precipitate is formed which dissolves on heating. Filter the hot solution and allow to cool. White crystals are formed which, when washed and dried at 100 °C to 105 °C, melt (2.2.14) at 137 °C to 140 °C.
- Ignite 1 g (cautiously, because of the risk of deflagration). Dissolve the residue in 10 ml of water *R*. The solution gives reaction (a) of chlorides (2.3.1).
- The solution prepared for identification test C gives reaction (a) of sulphates (2.3.1).
- The solution prepared for identification test C gives reaction (b) of sodium (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in carbon dioxide-free water *R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 8.0 to 10.0.

Ortho compound. To 2 g add 10 ml of water *R*, mix, add 1 g of sodium metabisulphite *R* and heat to boiling. Cool to 0 °C, filter rapidly and wash with three quantities, each of 5 ml, of iced water *R*. The precipitate, dried over diphosphorus pentoxide *R* at a pressure not exceeding 600 Pa melts (2.2.14) at a temperature not lower than 134 °C.

Residue insoluble in ethanol. Shake 1.00 g for 30 min with 20 ml of ethanol *R*, filter on a tared filter, wash any residue with 5 ml of ethanol *R* and dry at 100 °C to 105 °C. The residue weighs not more than 20 mg (2 per cent).

ASSAY

Dissolve 0.125 g in 100 ml of water *R* in a ground-glass-stoppered flask. Add 1 g of potassium iodide *R* and 5 ml of dilute sulphuric acid *R*. Allow to stand for 3 min. Titrate with 0.1 M sodium thiosulphate, using 1 ml of starch solution *R* as indicator.

1 ml of 0.1 M sodium thiosulphate is equivalent to 14.08 mg of C₇H₇ClNNaO₂S·3H₂O.

STORAGE

Store in an airtight container, protected from light, at a temperature of 8 °C to 15 °C.

01/2005:0532

TRAGACANTH

Tragacantha

DEFINITION

Tragacanth is the air-hardened, gummy exudate, flowing naturally or obtained by incision from the trunk and branches of *Astragalus gummifer* Labill. and certain other species of *Astragalus* from western Asia.

CHARACTERS

It has the macroscopic and microscopic characters described under identification test A and B.

IDENTIFICATION

- A. Tragacanth occurs in thin, flattened, ribbon-like, white or pale yellow, translucent strips, about 30 mm long and 10 mm wide and up to 1 mm thick, more or less curved; horny, fracture short; the surface is marked by fine longitudinal striae and concentric transverse ridges. It may also contain pieces similar in shape but somewhat thicker, more opaque and more difficult to fracture.
- B. Reduce to a powder (355). The powder is white or almost white and it forms a mucilaginous gel with about ten times its mass of *water R*. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows in the gummy mass numerous stratified cellular membranes turning slowly violet when treated with *iodinated zinc chloride solution R*. The gummy mass includes starch grains, isolated or in small groups, usually rounded in shape and sometimes deformed, with diameters varying between 4 µm and 10 µm, occasionally up to 20 µm, and a central hilum visible between crossed nicol prisms.
- C. Examine the chromatograms obtained in the test for acacia. The chromatogram obtained with the test solution shows three zones, corresponding to galactose, arabinose and xylose. A faint yellowish zone at the solvent front and a greyish-green zone between the zones due to galactose and arabinose may be present.
- D. Moisten 0.5 g of the powdered drug (355) with 1 ml of *alcohol R* and add gradually, while shaking, 50 ml of *water R* until a homogeneous mucilage is obtained. To 5 ml of the mucilage add 5 ml of *water R* and 2 ml of *barium hydroxide solution R*. A slight flocculent precipitate is formed. Heat on a water-bath for 10 min. An intense yellow colour develops.

TESTS

Acacia. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. To 100 mg of the powdered drug (355) in a thick-walled, centrifuge test tube, add 2 ml of a 100 g/l solution of *trifluoroacetic acid R*, shake vigorously to dissolve the forming gel, stopper the test tube and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant carefully into a 50 ml flask, add 10 ml of *water R* and evaporate the solution to dryness under reduced pressure. To the resulting clear film add 0.1 ml of *water R* and 0.9 ml of *methanol R*. Centrifuge

to separate the amorphous precipitate and dilute the supernatant if necessary to 1 ml with *methanol R*.

Reference solution. Dissolve 10 mg of *arabinose R*, 10 mg of *galactose R*, 10 mg of *rhamnose R* and 10 mg of *xylose R* in 1 ml of *water R* and dilute to 10 ml with *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of a 16 g/l solution of *sodium dihydrogen phosphate R*, 40 volumes of *butanol R* and 50 volumes of *acetone R*. Dry the plate in a current of warm air for a few minutes and again develop over a path of 15 cm using the same mobile phase. Dry the plate at 110 °C for 10 min, spray with *anisaldehyde solution R* and dry again at 110 °C for 10 min. The chromatogram obtained with the reference solution shows four clearly separated coloured zones due to galactose (greyish-green to green), arabinose (yellowish-green), xylose (greenish-grey or yellowish-grey) and rhamnose (yellowish-green), in order of increasing R_f value. The chromatogram obtained with the test solution does not show a yellowish-green zone corresponding to the zone of rhamnose in the chromatogram obtained with the reference solution.

Methylcellulose. Examine the chromatograms obtained in the test for acacia. The chromatogram obtained with the test solution does not show a red zone near the solvent front.

Sterculia gum

- A. Place 0.2 g of the powdered drug (355) in a 10 ml ground-glass-stoppered cylinder graduated in 0.1 ml. Add 10 ml of *alcohol (60 per cent V/V) R* and shake. Any gel formed occupies not more than 1.5 ml.
- B. To 1.0 g of the powdered drug (355) add 100 ml of *water R* and shake. Add 0.1 ml of *methyl red solution R*. Not more than 5.0 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Foreign matter. Place 2.0 g of the powdered drug (355) in a 250 ml round-bottomed flask and add 95 ml of *methanol R*. Swirl to moisten the powder and add 60 ml of *hydrochloric acid R1*. Add a few glass beads about 4 mm in diameter and heat on a water-bath under a reflux condenser for 3 h, shaking occasionally. Remove the glass beads and filter the hot suspension *in vacuo* through a sintered-glass filter (160). Rinse the flask with a small quantity of *water R* and pass the rinsings through the filter. Wash the residue on the filter with about 40 ml of *methanol R* and dry to constant mass at 110 °C (about 1 h). Allow to cool in a desiccator and weigh. The residue weighs not more than 20 mg (1.0 per cent).

Flow time. Not less than 10 s or, if the substance to be examined is to be used for the preparation of emulsions, not less than 50 s. Place 1.0 g of the powdered drug (125 to 250) in a 1000 ml round bottomed flask with a ground-glass stopper and add 8.0 ml of *alcohol R* and close the flask. Disperse the suspension over the inner surface of the flask by shaking, taking care not to wet the stopper. Open the flask and add in one portion 72.0 ml of *water R*. Stopper the flask and shake vigorously for 3 min. Allow to stand for 24 h and shake vigorously again for 3 min. Eliminate air bubbles by applying vacuum above the mucilage for 5 min. Transfer the mucilage to a 50 ml cylinder. Dip in the mucilage a piece of glass tubing 200 mm long and 6.0 mm in internal diameter and graduated at 20 mm and 120 mm from the lower end; the tubing must not be rinsed with surface-active substances. When the mucilage has reached the upper mark, close the tube with a finger. Withdraw the closed tube, remove the finger and measure with a stop-watch the time needed for the meniscus to reach the lower graduation. Carry out this operation four times and determine the average value of the last three determinations.

Total ash (2.4.16). Not more than 4.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^4 micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

STORAGE

Store protected from light.

LABELLING

The label states whether or not the contents are suitable for preparing emulsions.

01/2005:1681

TRAMADOL HYDROCHLORIDE

Tramadoli hydrochloridum

$C_{16}H_{26}ClNO_2$

M_r 299.8

DEFINITION

(1*RS*,2*RS*)-2-[(Dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexanol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: freely soluble in water and in methanol, very slightly soluble in acetone.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

A. Melting point (2.2.14): 180 °C to 184 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Comparison: tramadol hydrochloride CRS.

C. Chromatograms obtained in the test for impurity E.

Results: the principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

Acidity. To 10 ml of solution S, add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 M hydrochloric acid. The solution is red. Not more than 0.4 ml of 0.01 M sodium hydroxide is required to change the colour of the indicator to yellow.

Optical rotation (2.2.7): -0.10° to $+0.10^\circ$, determined on solution S.

Impurity E. Thin-layer chromatography (2.2.27).

Test solution (a). Dissolve 0.10 g in *methanol R* and dilute to 2 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 25 mg of tramadol hydrochloride CRS in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of tramadol impurity E CRS in 5 ml of *methanol R*. Dilute 1 ml of the solution to 10 ml with *methanol R*.

Reference solution (c). Dissolve 5 mg of tramadol impurity A CRS in 1 ml of reference solution (a).

Plate: TLC silica gel F_{254} plate R, prewashed with *methanol R*.

Mobile phase: concentrated ammonia R, 2-propanol R, toluene R (1:19:80 V/V/V).

Application: 10 μ l.

Development: over 2/3 of the plate. Saturate the plate for 20 min with concentrated ammonia R. For this, add concentrated ammonia R to one trough of a twin trough tank. Just before developing, add the mobile phase to the other trough. Place the plate in the chromatographic tank, ensuring that the layer of silica gel is orientated towards the middle of the tank.

Drying: in air.

Detection: expose the plate to iodine vapour for 1 h, examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (c) shows 2 clearly separated spots.

Limit: in the chromatogram obtained with test solution (a):

- **impurity E:** any spot corresponding to impurity E is not more intense and not greater than the spot in the chromatogram obtained with reference solution (b) (0.2 per cent).

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.15 g of the substance to be examined in the mobile phase and dilute to 100 ml with the mobile phase.

Reference solution (a). Dilute 2.0 ml of the test solution to 10.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 100 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of tramadol impurity A CRS in 4.0 ml of the test solution and dilute to 100 ml with the mobile phase.

Column:

- **size:** $l = 0.25$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** base-deactivated end-capped octylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: 295 volumes of acetonitrile R and 705 volumes of a mixture of 0.2 ml of trifluoroacetic acid R and 100 ml of water R.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 270 nm.

Injection: 20 μ l.

Run time: 4 times the retention time of tramadol.

Relative retention with reference to tramadol (retention time = about 5 min): impurity A = about 0.85.

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to impurity A and tramadol.

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent),
- **any other impurity:** not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than twice the area of the principal peak in the chromatogram obtained with reference solution (a) (0.4 per cent),
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of this solution complies with limit test A. Prepare the standard using *lead standard solution* (2 ppm Pb) *R*.

Water (2.5.12): maximum 0.5 per cent, determined on 1.000 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 25 ml of *anhydrous acetic acid R* and add 10 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 29.98 mg of $C_{16}H_{26}ClNO_2$.

STORAGE

Protected from light.

IMPURITIES

- A. (1*RS*,2*SR*)-2-[(dimethylamino)methyl]-1-(3-methoxyphenyl)cyclohexanol,

- B. [2-(3-methoxyphenyl)cyclohex-1-en-1-yl]-*N,N*-dimethylmethanamine,

- C. (1*RS*)-[2-(3-methoxyphenyl)cyclohex-2-en-1-yl]-*N,N*-dimethylmethanamine,

- D. (1*RS*,2*RS*)-2-[(dimethylamino)methyl]-1-(3-hydroxyphenyl)cyclohexanol,

- E. (2*RS*)-2-[(dimethylamino)methyl]cyclohexanone.

corrected

TRAMAZOLINE HYDROCHLORIDE MONOHYDRATE

Tramazolini hydrochloridum
monohydricum

$C_{13}H_{18}ClN_3 \cdot H_2O$

M_r 269.8

DEFINITION

N-(5,6,7,8-Tetrahydronaphthalen-1-yl)-4,5-dihydro-1*H*-imidazol-2-amine hydrochloride monohydrate.

Content: 98.5 per cent to 101.5 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: soluble in water and in alcohol.

IDENTIFICATION

- A. Infrared absorption spectrophotometry (2.2.24).

Comparison: tramazoline hydrochloride monohydrate CRS.

- B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, Method II).

pH (2.2.3): 4.9 to 6.3 for solution S.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 50.0 mg of the substance to be examined in a mixture of 50 volumes of *acetonitrile R* and 50 volumes of *water R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10.0 mg of tramazoline impurity A CRS and 10.0 mg of tramazoline impurity B CRS in 10 ml of a mixture of 50 volumes of acetonitrile R and 50 volumes of water R and add 10 ml of the test solution.

Reference solution (b). Dilute 0.2 ml of reference solution (a) to 100 ml with a mixture of 50 volumes of acetonitrile R and 50 volumes of water R.

Column:

- size: $l = 0.125$ m, $\varnothing = 4$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: 2.0 g/l solution of sodium dodecyl sulphate R in a mixture of 6 volumes of 2-propanol R, 42 volumes of acetonitrile R and 52 volumes of water R.

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 215 nm.

Injection: 5 μ l.

Run time: 3 times the retention time of tramazoline.

Relative retentions with reference to tramazoline (retention time = about 6.5 min): impurity A = about 0.71; impurity B = about 0.86.

System suitability: reference solution (a):

- the chromatogram obtained shows 3 clearly separated peaks,
- resolution: minimum 1.5 between tramazoline and impurity B.

Limits:

- impurity A: not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- impurity B: not more than 3 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),
- any other impurity: not more than the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.1 per cent),
- total of other impurities: not more than 2 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.2 per cent),
- disregard limit: 0.2 times the area of the peak due to impurity B in the chromatogram obtained with reference solution (b) (0.02 per cent).

Water (2.5.12): 6.2 per cent to 7.2 per cent, determined on 0.500 g.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 2.000 g in a mixture of 5 ml of 0.1 M hydrochloric acid and 75 ml of alcohol R. Carry out a potentiometric titration (2.2.20) using 1 M sodium hydroxide. Read the volume added between the 2 points of inflexion.

1 ml of 1 M sodium hydroxide is equivalent to 251.8 mg of $C_{13}H_{18}ClN_3$.

IMPURITIES

A. *N*-(naphthalen-1-yl)-4,5-dihydro-1*H*-imidazol-2-amine,

B. mixture of 1-acetyl-2-[(5,6,7,8-tetrahydronaphthalen-1-yl)amino]-4,5-dihydro-1*H*-imidazole and *N*-(4,5-dihydro-1*H*-imidazol-2-yl)-*N*-(5,6,7,8-tetrahydronaphthalen-1-yl)acetamide.

01/2005:0875

TRANEXAMIC ACID

Acidum tranexamicum

$C_8H_{15}NO_2$

M_r 157.2

DEFINITION

Trans-4-(aminomethyl)cyclohexanecarboxylic acid.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: freely soluble in water and in glacial acetic acid, practically insoluble in acetone and in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: tranexamic acid CRS.

TESTS

pH (2.2.3): 7.0 to 8.0.

Dissolve 2.5 g in carbon dioxide-free water R and dilute to 50 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.20 g of the substance to be examined in water R and dilute to 20.0 ml with the same solvent.

Reference solution (a). Dilute 5.0 ml of the test solution to 100.0 ml with water R. Dilute 1.0 ml of this solution to 10.0 ml with water R.

Reference solution (b). Dissolve 5 mg of tranexamic acid impurity C CRS in water R and dilute to 50.0 ml with the same solvent. To 1.0 ml of this solution add 1.0 ml of the test solution and dilute to 50.0 ml with water R.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.6$ mm or $l = 0.25$ m, $\varnothing = 6.0$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: dissolve 11.0 g of anhydrous sodium dihydrogen phosphate R in 500 ml of water R, add 5 ml of triethylamine R and 1.4 g of sodium laurilsulfate R. Adjust to pH 2.5 with dilute phosphoric acid R and dilute to 600 ml with water R. Add 400 ml of methanol R and mix.

Flow rate: 0.9 ml/min.

Detection: spectrophotometer at 220 nm.

Injection: 20 µl.

Run time: 3 times the retention time of tranexamic acid.

Relative retentions with reference to tranexamic acid (retention time = about 13 min): impurity C = about 1.1; impurity D = about 1.3; impurity B = about 1.5; impurity A = about 2.1.

System suitability: reference solution (b):

- **resolution:** minimum of 2.0 between the peaks due to tranexamic acid and to impurity C.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 1.2; impurity C = 0.005; impurity D = 0.006;
- **impurity A:** not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- **impurity B:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- **any other impurity:** not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- **total of other impurities:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- **disregard limit:** 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.025 per cent).

Halides expressed as chlorides (2.4.4): maximum 140 ppm.

Dissolve 1.2 g in *water R* and dilute to 50 ml with the same solvent. 15 ml of this solution complies with the limit test for chlorides.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in *water R* and dilute to 20 ml with the same solvent. 12 ml of this solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.140 g in 20 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 15.72 mg of C₈H₁₅NO₂.

IMPURITIES

Specified impurities: A, B.

Other detectable impurities: C, D.

A. *trans,trans*-4,4'-(iminodimethylene)di(cyclohexanecarboxylic) acid,

B. *cis*-4-(aminomethyl)cyclohexanecarboxylic acid,

and enantiomer

C. (*RS*)-4-(aminomethyl)cyclohex-1-enecarboxylic acid,

D. 4-aminomethylbenzoic acid.

01/2005:1576

TRAPIDIL

Trapidilum

C₁₀H₁₅N₅

M_r 205.3

DEFINITION

N,N-Diethyl-5-methyl-[1,2,4]triazolo[1,5-*a*]pyrimidin-7-amine.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: freely soluble in water, soluble in ethanol and in methylene chloride.

mp: about 102 °C.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *trapidil CRS*.

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.2 ml of *methyl red solution R* and 0.2 ml of 0.01 M *hydrochloric acid*. The solution is red. Add 0.4 ml of 0.01 M *sodium hydroxide*. The solution is yellow.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dissolve 5.0 mg of *trapidil impurity A CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of *trapidil impurity B CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Mix equal volumes of reference solution (a) and reference solution (b).

Column:

- **size:** $l = 0.125$ m, $\varnothing = 4.0$ mm,
- **stationary phase:** base-deactivated octadecylsilyl silica gel for chromatography R (5 μ m),

Mobile phase: 50 ml of *methanol R*, 75 ml of *acetonitrile R* and 800 ml of a 1.7 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 2.45 with *phosphoric acid R*; dilute to 1000 ml with *water R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 205 nm.

Injection: 10 μ l.

Run time: 3 times the retention time of *trapidil*.

System suitability:

- **resolution:** minimum of 4.0 between the peaks due to impurity A and impurity B in the chromatogram obtained with reference solution (c).

Limits:

- **impurity A:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **impurity B:** not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- **any other impurity:** not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- **total:** not more than 5 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.5 per cent).
- **disregard limit:** 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.01 per cent).

Chlorides (2.4.4): maximum 100 ppm.

Dissolve 0.25 g in 10 ml of *water R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides. Prepare the standard using 5 ml of *chloride standard solution (5 ppm Cl) R*.

Ammonium (2.4.1): maximum 20 ppm.

0.50 g complies with limit test A. Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in 20 ml of *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using 1 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying *in vacuo* at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.180 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 20.53 mg of C₁₀H₁₅N₅.

STORAGE

Protected from light.

IMPURITIES

A. 5-methyl-[1,2,4]triazolo[1,5-a]pyrimidin-7-ol,

B. 1,2,4-triazol-3-amine.

01/2005:0693

TRETINOIN

Tretinoinum

C₂₀H₂₈O₂

*M*_r 300.4

DEFINITION

Tretinoin contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (2*E*,4*E*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid, calculated with reference to the dried substance.

CHARACTERS

A yellow or light orange, crystalline powder, practically insoluble in water, soluble in methylene chloride, slightly soluble in alcohol. It is sensitive to air, heat and light, especially in solution.

It melts at about 182 °C, with decomposition.

Carry out all operations as rapidly as possible and avoid exposure to actinic light; use freshly prepared solutions.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Dissolve 75.0 mg in 5 ml of *methylene chloride R* and dilute immediately to 100.0 ml with acidified 2-propanol (prepared by diluting 1 ml of 0.01 M *hydrochloric acid* to 1000 ml with 2-propanol R). Dilute 5.0 ml of this solution to 100.0 ml with the acidified 2-propanol. Dilute 5.0 ml of this latter solution to 50.0 ml with the acidified 2-propanol. Examined between 300 nm and 400 nm (2.2.25), the solution shows a single maximum, at 353 nm. The specific absorbance at the maximum is 1455 to 1545.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tretinoin CRS*. Examine the substances prepared as discs.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *tretinoin CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply separately to the plate 5 µl of each solution.

Develop over a path of 15 cm using a mixture of 2 volumes of *glacial acetic acid R*, 4 volumes of *acetone R*, 40 volumes of *peroxide-free ether R* and 54 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

D. Dissolve about 5 mg in 2 ml of *antimony trichloride solution R*. An intense red colour develops and later becomes violet.

TESTS

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 0.100 g of the substance to be examined in *methanol R* and dilute to 50.0 ml with the same solvent.

Reference solution (a). Dissolve 10.0 mg of *isotretinoin CRS* in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with *methanol R*.

Reference solution (c). Mix 1.0 ml of reference solution (a) with 0.5 ml of the test solution and dilute to 25.0 ml with *methanol R*.

Reference solution (d). Dilute 0.5 ml of the test solution to 100.0 ml with *methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 5 volumes of *glacial acetic acid R*, 225 volumes of *water R* and 770 volumes of *methanol R*,
- as detector a spectrophotometer set at 355 nm.

Inject separately 10 µl of reference solutions (b), (c) and (d) and of the test solution. Adjust the sensitivity of the detector so that the height of the principal peak in the chromatogram obtained with reference solution (b) is about 70 per cent of the full scale of the recorder. The test is not valid unless the resolution between isotretinoin and tretinoin in the chromatogram obtained with reference solution (c) is at least 2.0. In the chromatogram obtained with the test solution, the area of the peak due to isotretinoin is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (2.0 per cent) and the sum of the areas of any peaks, apart from the principal peak and any peak due to isotretinoin, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (d) (0.5 per cent).

Heavy metals (2.4.8). 0.5 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 1 ml of *lead standard solution* (10 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 70 ml of *acetone R*. Titrate with 0.1 M *tetrabutylammonium hydroxide* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *tetrabutylammonium hydroxide* is equivalent to 30.04 mg of C₂₀H₂₈O₂.

STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding 25 °C.

It is recommended that the contents of an opened container be used as soon as possible and any unused part be protected by an atmosphere of an inert gas.

IMPURITIES

A. isotretinoin,

B. R = CO₂H, R' = H: (2*Z*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (9,13-di-*cis*-retinoic acid),

D. R = H, R' = CO₂H: (2*E*,4*E*,6*Z*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (9-*cis*-retinoic acid),

C. (2*Z*,4*Z*,6*E*,8*E*)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraenoic acid (11,13-di-*cis*-retinoic acid),

E. oxidation products of tretinoin.

01/2005:1106
corrected

TRIACETIN

Triacetinum

C₉H₁₄O₆

M_r 218.2

DEFINITION

Triacetin contains not less than 97.0 per cent and not more than the equivalent of 100.5 per cent of propane-1,2,3-triyl triacetate, calculated with reference to the anhydrous substance.

CHARACTERS

A clear, colourless, slightly viscous oily liquid. It is soluble in water, miscible with ethanol and toluene. It boils at about 260 °C.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of triacetin*.

TESTS

Appearance. It is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity. Dissolve 5.00 g in 25 ml of *ethanol R*, previously neutralised to 0.2 ml of *phenolphthalein solution R* and add 0.20 ml of 0.1 M *sodium hydroxide*. The pink colour of the mixture persists for 15 s.

Relative density (2.2.5): 1.159 to 1.164.

Refractive index (2.2.6): 1.429 to 1.432.

Water (2.5.12). Not more than 0.2 per cent, determined on 5.00 g by the semi-micro determination of water.

ASSAY

Introduce 0.300 g of the substance to be examined into a 250 ml borosilicate glass flask fitted with a reflux condenser. Add 25.0 ml of 0.5 M *alcoholic potassium hydroxide* and a few glass beads. Attach the condenser and heat under reflux for 30 min. Add 1 ml of *phenolphthalein solution R1* and titrate immediately with 0.5 M *hydrochloric acid*. Carry out a blank test under the same conditions. Calculate the content from the difference in consumption of alkali in the main and the blank procedure.

1 ml of 0.5 M *alcoholic potassium hydroxide* is equivalent to 36.37 mg of C₉H₁₄O₆.

STORAGE

Store in a well-filled container.

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, slightly soluble in methanol, practically insoluble in methylene chloride.

It shows polymorphism.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: triamcinolone CRS.

If the spectra obtained show differences, dissolve the substance to be examined and the reference substance separately in *methanol R*, evaporate to dryness, dry the residues at 60 °C at a pressure not exceeding 0.7 kPa and record new spectra using the residues.

B. Thin-layer chromatography (2.2.27). *Prepare the solutions immediately before use and protect from light. Examine the plate under ultraviolet light immediately after development.*

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *triamcinolone CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *dexamethasone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Plate: TLC silica gel F₂₅₄ plate *R*.

Mobile phase: add a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*.

Application: 5 µl.

Development: over a path of 15 cm.

Drying: in air.

Detection: examine in ultraviolet light at 254 nm.

System suitability: the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Specific optical rotation (2.2.7): + 65 to + 72 (anhydrous substance).

Dissolve 0.100 g in *dimethylformamide R* and dilute to 10.0 ml with the same solvent.

Related substances. Liquid chromatography (2.2.29).

Prepare the solutions immediately before use and protect from light.

Test solution. Dissolve 25.0 mg of the substance to be examined in a mixture of equal volumes of *methanol R* and *water R* and dilute to 10.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 2 mg of *triamcinolone CRS* and 2 mg of *triamcinolone impurity C CRS* in a mixture of equal volumes of *methanol R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with a mixture of equal volumes of *methanol R* and *water R*.

Blank: *methanol R*.

Column:

— size: *l* = 0.25 m, Ø = 4.6 mm,

01/2005:1376

TRIAMCINOLONE

Triamcinolonum

C₂₁H₂₇FO₆M_r 394.4

DEFINITION

9-Fluoro-11β,16α,17,21-tetrahydroxypregna-1,4-diene-3,20-dione.

Content: 97.0 per cent to 103.0 per cent (anhydrous substance).

- *stationary phase*: base-deactivated end-capped octadecylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase: a mixture prepared as follows: in a 1000 ml volumetric flask mix 525 ml of *methanol R* with 400 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again.

Flow rate: 1 ml/min.

Detection: spectrophotometer set at 238 nm.

Injection: 20 µl.

Run time: 4.5 times the retention time of triamcinolone.

Retention time: triamcinolone = about 11 min.

System suitability: reference solution (a):

- *resolution*: minimum of 1.8 between the peaks due to triamcinolone and to impurity C.

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent) and not more than 2 such peaks have an area greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (2 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Water (2.5.12): maximum 1.0 per cent, determined on 0.500 g.

ASSAY

Prepare the solutions immediately before use and protect from light.

Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of the solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238 nm.

Calculate the content of $C_{21}H_{27}FO_6$ taking the specific absorbance to be 389.

STORAGE

Protected from light.

IMPURITIES

- A. $R_1 = R_2 = CO-CH_3$: 9-fluoro-11β,17-dihydroxy-3,20-dioxopregna-1,4-diene-16α,21-diyl diacetate (triamcinolone 16,21-diacetate),
- B. $R_1 = H, R_2 = CO-CH_3$: 9-fluoro-11β,16α,17-trihydroxy-3,20-dioxopregna-1,4-dien-21-yl acetate (triamcinolone 21-acetate),

C. 9-fluoro-11β,16α,17,21-tetrahydroxypregna-4-ene-3,20-dione (pretriamcinolone).

01/2005:0533

TRIAMCINOLONE ACETONIDE

Triamcinoloni acetonidum

$C_{24}H_{31}FO_6$

M_r 434.5

DEFINITION

Triamcinolone acetonide contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β,21-dihydroxy-16α,17-(1-methylethylidenedioxy)pregna-1,4-diene-3,20-dione, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in alcohol.

It shows polymorphism.

IDENTIFICATION

First identification: A, B.

Second identification: C, D.

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *triamcinolone acetonide CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum volume of *methanol R* and evaporate to dryness. Using the residues, prepare halogen salt discs or mulls in *liquid paraffin R* and record the spectra again.
- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. *Prepare the solutions immediately before use and protect from light. Examine the plate in ultraviolet light immediately after development.*

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *triamcinolone acetonide CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *triamcinolone hexacetone CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. Prepare the solutions immediately before use and protect from light. Examine the plate in ultraviolet light immediately after development.

Test solution (a). Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Test solution (b). In a separating funnel, dissolve 10 mg of the substance to be examined in 1.5 ml of *glacial acetic acid R*, add 0.5 ml of a 20 g/l solution of *chromium trioxide R* and allow to stand for 60 min. Add 5 ml of *water R*, 2 ml of *methylene chloride R* and shake vigorously for 2 min. Allow to separate and use the lower layer.

Reference solution (a). Dissolve 10 mg of *triamcinolone acetonide CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). In a separating funnel, dissolve 10 mg of *triamcinolone acetonide CRS* in 1.5 ml of *glacial acetic acid R*, add 0.5 ml of a 20 g/l solution of *chromium trioxide R* and allow to stand for 60 min. Add 5 ml of *water R*, 2 ml of *methylene chloride R* and shake vigorously for 2 min. Allow to separate and use the lower layer.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in each of the chromatograms obtained with the test solutions is similar in position and size to the principal spot in the chromatogram obtained with the corresponding reference solution. The principal spots in the chromatograms obtained with test solution (b) and reference solution (b) have an R_f value distinctly higher than that of the principal spots in the chromatograms obtained with test solution (a) and reference solution (a).

- D. Mix about 5 mg with 45 mg of *heavy magnesium oxide R* and ignite in a crucible until an almost white residue is obtained (usually less than 5 min). Allow to cool, add 1 ml of *water R*, 0.05 ml of *phenolphthalein solution R1* and about 1 ml of *dilute hydrochloric acid R* to render the solution colourless. Filter. To a freshly prepared mixture of 0.1 ml of *alizarin S solution R* and 0.1 ml of *zirconyl nitrate solution R*, add 1.0 ml of the filtrate. Mix, allow to stand for 5 min and compare the colour of the solution with that of a blank prepared in the same manner. The test solution is yellow and the blank is red.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.100 g in *dioxan R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 100 to + 107, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29). Carry out the test protected from light.

Test solution. Dissolve 25.0 mg of the substance to be examined in 7 ml of *methanol R* and dilute to 10.0 ml with *water R*.

Reference solution (a). Dissolve 2 mg of *triamcinolone acetonide CRS* and 2 mg of *triamcinolone R* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 525 ml of *methanol R* with 400 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 1.5 ml/min for about 10 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: triamcinolone about 5 min and triamcinolone acetonide about 17 min. The test is not valid unless the resolution between the peaks corresponding to triamcinolone and triamcinolone acetonide is at least 15; if necessary, adjust the concentration of methanol in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for 3.5 times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.25 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12). Not more than 2.0 per cent, determined on 0.500 g by the semi-micro determination of water.

ASSAY

Protect the solutions from light throughout the assay.

Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238.5 nm.

Calculate the content of $C_{24}H_{31}FO_6$ taking the specific absorbance to be 355.

STORAGE

Store protected from light.

IMPURITIES

A. triamcinolone.

01/2005:0867

TRIAMCINOLONE HEXACETONIDE

Triamcinoloni hexacetonidum

$C_{30}H_{41}FO_7$

M_r 532.6

DEFINITION

Triamcinolone hexacetonide contains not less than 97.0 per cent and not more than the equivalent of 103.0 per cent of 9-fluoro-11β-hydroxy-16α,17-(1-methylethylidenedioxy)-3,20-dioxopregna-1,4-diene-21-yl 3,3-dimethylbutanoate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, practically insoluble in water, sparingly soluble in ethanol and in methanol.

IDENTIFICATION

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *triamcinolone hexacetonide CRS*.
- B. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm. *Prepare the solutions immediately before use and protect from light. Examine the plate in ultraviolet light immediately after development.*

Test solution. Dissolve 10 mg of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of *triamcinolone hexacetonide CRS* in *methanol R* and dilute to 20 ml with the same solvent.

Reference solution (b). Dissolve 10 mg of *triamcinolone acetonide CRS* in reference solution (a) and dilute to 10 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Prepare the mobile phase by adding a mixture of 1.2 volumes of *water R* and 8 volumes of *methanol R* to a mixture of 15 volumes of *ether R* and 77 volumes of *methylene chloride R*. Develop over a path of 15 cm. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows two clearly separated spots.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.100 g in *methylene chloride R* and dilute to 10.0 ml with the same solvent. The specific optical rotation is + 92 to + 98, calculated with reference to the anhydrous substance.

Related substances. Examine by liquid chromatography (2.2.29). *Carry out the test protected from light.*

Test solution. Dissolve 25.0 mg of the substance to be examined in *methanol R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve 2 mg of *triamcinolone hexacetonide CRS* and 2 mg of *triamcinolone acetonide CRS* in the mobile phase and dilute to 100.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min a mixture prepared as follows: in a 1000 ml volumetric flask mix 750 ml of *methanol R* with 200 ml of *water R* and allow to equilibrate; adjust the volume to 1000 ml with *water R* and mix again,
- as detector a spectrophotometer set at 254 nm.

Equilibrate the column with the mobile phase at a flow rate of 2 ml/min for about 10 min.

Adjust the sensitivity of the system so that the height of the principal peak in the chromatogram obtained with 20 µl of reference solution (b) is at least 50 per cent of the full scale of the recorder.

Inject 20 µl of reference solution (a). When the chromatograms are recorded in the prescribed conditions, the retention times are: triamcinolone acetonide about 3 min and triamcinolone hexacetonide about 12 min. The test is not valid unless the resolution between the peaks corresponding to triamcinolone acetonide and triamcinolone hexacetonide is at least 20.0; if necessary, adjust the concentration of methanol in the mobile phase.

Inject separately 20 µl of the test solution and 20 µl of reference solution (b). Continue the chromatography for three times the retention time of the principal peak in the chromatogram obtained with the test solution. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than half the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent); the sum of the areas of all the peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (1 per cent). Disregard any peak due to the solvent and any peak with an area less than 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Water (2.5.12). Not more than 2.0 per cent, determined on 0.50 g by the semi-micro determination of water.

ASSAY

Dissolve 50.0 mg in *alcohol R* and dilute to 50.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with *alcohol R*. Measure the absorbance (2.2.25) at the maximum at 238 nm.

Calculate the content of $C_{30}H_{41}FO_7$ taking the specific absorbance to be 291.

STORAGE

Store protected from light.

IMPURITIES

A. triamcinolone acetonide.

01/2005:0058

TRIAMTERENE

Triamterenum

 $C_{12}H_{11}N_7$
 M_r 253.3

DEFINITION

Triamterene contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 6-phenylpteridine-2,4,7-triamine, calculated with reference to the dried substance.

CHARACTERS

A yellow, crystalline powder, very slightly soluble in water and in alcohol.

IDENTIFICATION

- A. Dissolve 0.1 g in a 10 per cent *V/V* solution of 1 *M* hydrochloric acid in ethanol *R* and dilute to 100 ml with the same acid mixture. Dilute 1 ml of this solution to 100 ml with a 10 per cent *V/V* solution of 1 *M* hydrochloric acid in ethanol *R*. Examined between 255 nm and 380 nm, the solution shows 2 absorption maxima (2.2.25), at 262 nm and 360 nm, and a shoulder at 285 nm.
- B. Examined in ultraviolet light at 365 nm, acid solutions, especially a 1 g/l solution in anhydrous formic acid *R*, show an intense blue fluorescence.

TESTS

Acidity. Boil 1.0 g with 20 ml of water *R* for 5 min, cool, filter and wash the filter with 3 quantities, each of 10 ml, of water *R*. Combine the filtrate and washings and add 0.3 ml of phenolphthalein solution *R*. Not more than 1.5 ml of 0.01 *M* sodium hydroxide is required to change the colour of the indicator.

Nitrosotriaminopyrimidine. Examine by thin-layer chromatography (2.2.27), using silica gel HF_{254} *R* as the coating substance.

Test solution. Dissolve 0.2 g of the substance to be examined in 5 ml of anhydrous formic acid *R*, stirring with a glass rod if necessary. Prepare immediately before use.

Reference solution. Dissolve 4 mg of nitrosotriaminopyrimidine *CRS* in anhydrous formic acid *R* and dilute to 100 ml with the same acid.

Apply separately to the plate as bands 1.5 cm long, 20 µl of each solution as 2 applications of 10 µl each, drying in a current of air after each application. Develop over a path of 5 cm using ether *R*. Allow the plate to dry in air and develop over a path of 10 cm using a mixture of 10 volumes of glacial acetic acid *R*, 10 volumes of methanol *R* and 80 volumes of ethyl acetate *R*, the mixture containing 0.5 g/l of sodium fluoresceinate *R*. Dry the plate in a current of air and expose to ammonia vapour for a few seconds. Examine in ultraviolet

light at 254 nm and at 365 nm. Any band corresponding to nitrosotriaminopyrimidine in the chromatogram obtained with the test solution is not more intense than the band in the chromatogram obtained with the reference solution (0.1 per cent).

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel *G R* as the coating substance.

Test solution. Dissolve 0.1 g of the substance to be examined in 20 ml of dimethyl sulphoxide *R*. Dilute 2 ml of the solution to 50 ml with methanol *R*.

Reference solution. Dilute 1 ml of the test solution to 200 ml with methanol *R*.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of concentrated ammonia *R1*, 10 volumes of methanol *R* and 90 volumes of ethyl acetate *R*. Allow the plate to dry in air until the solvents have evaporated and examine in ultraviolet light at 365 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.00 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 5 ml of anhydrous formic acid *R* and add 100 ml of anhydrous acetic acid *R*. Titrate with 0.1 *M* perchloric acid determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* perchloric acid is equivalent to 25.33 mg of $C_{12}H_{11}N_7$.

STORAGE

Store protected from light.

01/2005:1740

TRIBENOSIDE

Tribenosidum

 $C_{29}H_{34}O_6$
 M_r 478.6

DEFINITION

Mixture of α - and β -anomers of ethyl 3,5,6-tri-*O*-benzyl-D-glucofuranoside.

Content: 96.0 per cent to 102.0 per cent.

CHARACTERS

Appearance: yellowish to pale yellow, clear, viscous liquid.

Solubility: practically insoluble in water, very soluble in acetone, in methanol and in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: tribenoside CRS.

TESTS

Solution S. Dissolve 4.00 g in *methanol R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and its absorbance (2.2.25) at 420 nm has a maximum of 0.10.

Specific optical rotation (2.2.7): –31.0 to –40.0.

Dilute 2.0 ml of solution S to 20.0 ml with *methanol R*.

Related substances. Liquid chromatography (2.2.29).

Test solution (a). Dissolve 1.000 g of the substance to be examined in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 25.0 ml with the same mixture of solvents.

Test solution (b). Dissolve 50.0 mg of the substance to be examined in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (a). Dilute 25.0 mg of *benzaldehyde R* and 30.0 mg of *tribenoside impurity A CRS* to 100.0 ml with *acetonitrile R*. Introduce 20.0 ml of this solution into a 50 ml volumetric flask, add 2.5 ml of *water R* and dilute to 50.0 ml with *acetonitrile R*.

Reference solution (b). Dissolve 50.0 mg of *tribenoside CRS* in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 50.0 ml with the same mixture of solvents.

Reference solution (c). Dissolve 12.0 mg of *benzyl ether R* in a mixture of 5 volumes of *water R* and 95 volumes of *acetonitrile R* and dilute to 100.0 ml with the same mixture of solvents.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography *R* (3 μ m).

Mobile phase:

- mobile phase A: 0.1 per cent V/V solution of *phosphoric acid R*,
- mobile phase B: *acetonitrile R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 40	55 $\rightarrow$ 10	45 $\rightarrow$ 90
40 - 55	10	90
55 - 56	10 $\rightarrow$ 55	90 $\rightarrow$ 45
56 - 60	55	45

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 254 nm.

Injection: 20 μ l; inject test solution (a) and reference solutions (a), (b) and (c).

Relative retentions with reference to the β -anomer of tribenoside (retention time = about 18 min): α -anomer = about 1.1; impurity C = about 0.2; impurity B = about 0.6; impurity D = about 0.8; impurity A = about 1.4.

System suitability: reference solution (b):

- resolution: minimum 3.0 between the peaks due to the α -anomer and to the β -anomer of tribenoside.

Limits:

- **impurity A:** not more than 1.7 times the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent),
- **impurity C:** not more than twice the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.5 per cent); if the area of the peak due to impurity C in the chromatogram obtained with the test solution is greater than the area of the corresponding peak in the chromatogram obtained with reference solution (a) (0.25 per cent), dilute the test solution to obtain an area equal to or smaller than the area of the peak in the chromatogram obtained with reference solution (a); calculate the content of impurity C taking into account the dilution factor;
- **impurity D:** not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.3 per cent),
- **any other impurity:** not more than the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (0.3 per cent),
- **total:** not more than 6.7 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (2.0 per cent),
- **disregard limit:** 0.17 times the area of the peak due to impurity A in the chromatogram obtained with reference solution (a) (0.05 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

Dilute 5.0 ml of solution S to 20.0 ml with *methanol R*. 12 ml of the solution complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with *methanol R*.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances with the following modification.

Injection: test solution (b) and reference solution (b).

Calculate the sum of the percentage contents of the α -anomer and the β -anomer of tribenoside.

STORAGE

Under nitrogen, in an airtight container.

IMPURITIES

A. $R = \text{CH}_2\text{-C}_6\text{H}_5$: 3,5,6-tri-*O*-benzyl-1,2-*O*-(1-methylethylidene)- α -D-glucofuranose,

B. $R = \text{H}$: 3,5-di-*O*-benzyl-1,2-*O*-(1-methylethylidene)- α -D-glucofuranose,

C. $\text{C}_6\text{H}_5\text{-CHO}$: benzaldehyde,

D. $\text{C}_6\text{H}_5\text{-CH}_2\text{-O-CH}_2\text{-C}_6\text{H}_5$: dibenzyl ether.

01/2005:1770 – injection port and detector: 250 °C.

TRIBUTYL ACETYLCITRATE

Tributylis acetylcitras

 $C_{20}H_{34}O_8$ M_r 402.5

DEFINITION

Tributyl 2-(acetyloxy)propane-1,2,3-tricarboxylate.

Content: 99.0 per cent to 101.0 per cent (anhydrous substance).

CHARACTERS

Appearance: clear, oily liquid.

Solubility: not miscible with water, miscible with alcohol and with methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of tributyl acetylcitrate.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).**Acidity.** Dilute 10 g with 10 ml of previously neutralised alcohol R, add 0.5 ml of bromothymol blue solution R2. Not more than 0.3 ml of 0.1 M sodium hydroxide is required to change the colour of the indicator to blue.**Refractive index** (2.2.6): 1.442 to 1.445.**Related substances.** Gas chromatography (2.2.28).**Test solution.** Dissolve 1.0 g of the substance to be examined in methylene chloride R and dilute to 20.0 ml with the same solvent.**Reference solution (a).** Dissolve 50 mg of the substance to be examined and 50 mg of tributyl citrate R in methylene chloride R and dilute to 20.0 ml with the same solvent.**Reference solution (b).** Dilute 1.0 ml of the test solution to 20.0 ml with methylene chloride R. Dilute 1.0 ml of this solution to 25.0 ml with methylene chloride R.

Column:

- material: fused silica,
- size: $l = 30$ m, $\varnothing = 0.53$ mm,
- stationary phase: poly[(cyanopropyl)(methyl)][(phenyl)(methyl)]siloxane R (film thickness 1.0 μ m).

Carrier gas: helium for chromatography R.

Linear velocity: 36 cm/s.

Split ratio: 1:20.

Temperature:

- column: 200 °C,

Detection: flame ionisation.

Injection: 1 μ l.

Run time: twice the retention time of tributyl acetylcitrate.

Relative retention with reference to tributyl acetylcitrate (retention time = about 26 min): impurity B = about 0.83; impurity A = about 0.87.

System suitability: reference solution (a):

- resolution: minimum 2.0 between the peaks due to impurity A and tributyl acetylcitrate.

Limits:

- impurities A, B: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent),
- any other impurity: for each impurity, not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent),
- total: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent),
- disregard limit: 0.25 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test F. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) R.

Water (2.5.12): maximum 0.25 per cent, determined on 2.00 g.**Sulphated ash** (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Introduce 1.500 g into a 250 ml borosilicate glass flask. Add 25 ml of 2-propanol R, 50 ml of water R, 25.0 ml of 1 M sodium hydroxide and a few glass beads. Heat under a reflux condenser for 1 h. Allow to cool. Add 1 ml of phenolphthalein solution R1 and titrate with 1 M hydrochloric acid. Carry out a blank titration.

1 ml of 1 M sodium hydroxide is equivalent to 100.6 mg of $C_{20}H_{34}O_8$.

IMPURITIES

Specified impurities: A, B.

A. tributyl 2-hydroxypropane-1,2,3-tricarboxylate (tributyl citrate),

B. tributyl propene-1,2,3-tricarboxylate (tributyl aconitate).

01/2005:1967

01/2005:1479

TRICHLOROACETIC ACID

Acidum trichloroaceticum

 $C_2HCl_3O_2$ M_r 163.4

DEFINITION

2,2,2-Trichloroacetic acid.

Content: 98.0 per cent to 100.5 per cent.

CHARACTERS

Appearance: white, crystalline mass or colourless crystals, very deliquescent.*Solubility*: very soluble in water, in alcohol and in methylene chloride.

IDENTIFICATION

First identification: A.*Second identification*: B, C.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of trichloroacetic acid.B. To 0.5 ml of solution S (see Tests) add 2 ml of *pyridine R* and 5 ml of *strong sodium hydroxide solution R*. Shake vigorously and heat in a water-bath at 60-70 °C for 5 min. The upper layer shows an intense red colour.

C. Solution S is strongly acidic (2.2.4).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 25 ml with the same solvent.**Appearance of solution**. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).**Chlorides** (2.4.4): maximum 100 ppm.Dilute 5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides.**Sulphated ash** (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 20 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).1 ml of 0.1 M *sodium hydroxide* is equivalent to 16.34 mg of $C_2HCl_3O_2$.

STORAGE

In an airtight container.

TRIETHYL CITRATE

Triethylis citras

 $C_{12}H_{20}O_7$ M_r 276.3

DEFINITION

Triethyl citrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of triethyl 2-hydroxypropane-1,2,3-tricarboxylate, calculated with reference to the anhydrous substance.

CHARACTERS

A clear, viscous, colourless or almost colourless liquid, hygroscopic, soluble in water, miscible with alcohol, slightly soluble in fatty oils.

IDENTIFICATION

First identification: A, B.*Second identification*: A, C, D.

A. It complies with the test for refractive index (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the Ph. Eur. reference spectrum of triethyl citrate.

C. It gives the reaction of esters (2.3.1).

D. To 0.5 ml add 5 ml of *alcohol R* and 4 ml of *dilute sodium hydroxide solution R*. Boil under reflux for about 10 min. 2 ml of the solution gives the reaction of citrates (2.3.1).

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).**Acidity**. Dilute 10 g with 10 ml of previously neutralised *alcohol R*, add 0.5 ml of *bromothymol blue solution R2*. Not more than 0.3 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to blue.**Refractive index** (2.2.6): 1.440 to 1.446.**Related substances**. Examine by gas chromatography (2.2.28).**Test solution**. Dissolve 1.0 ml of the substance to be examined in *methylene chloride R* and dilute to 50.0 ml with the same solvent.**Reference solution (a)**. Dissolve 1.0 ml of the substance to be examined and 0.5 ml of *methyl tridecanoate R* in *methylene chloride R* and dilute to 50.0 ml with the same solvent.

The chromatographic procedure may be carried out using:

- a fused-silica column 30 m long and 0.32 mm in internal diameter coated with *poly(dimethyl)siloxane R* (5 µm),
 - *helium for chromatography R* as the carrier gas with a split ratio of about 1:50 and a linear velocity of about 26 cm/s,
 - a flame-ionisation detector,
- maintaining the temperature of the column at 200 °C and that of the injection port and the detector at 220 °C.

Inject 1.0 µl of each of the solutions. Continue the chromatography for twice the retention time of triethyl citrate which is about 13.6 min.

The test is not valid unless in the chromatogram obtained with reference solution (a), the resolution between the peaks corresponding to triethyl citrate and methyl tridecanoate is at least 1.5.

Calculate the percentage content of related substances from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure, disregarding any peaks with an area less than 0.04 per cent of the area of the principal peak. The content of any related substance is not greater than 0.2 per cent and the sum is not greater than 0.5 per cent.

Heavy metals (2.4.8). Dissolve 4.0 g in 8 ml of *alcohol R* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test B for heavy metals (5 ppm). Prepare the standard using lead standard solution (1 ppm) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of equal volumes of *alcohol R* and *water R*.

Water (2.5.12). Not more than 0.25 per cent, determined on 1.000 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Introduce 1.500 g into a 250 ml borosilicate-glass flask fitted with a reflux condenser. Add 25 ml of *2-propanol R*, 50 ml of *water R*, 25.0 ml of 1 M *sodium hydroxide* and a few glass beads. Heat under a reflux condenser for 1 h. Allow to cool. Add 1 ml of *phenolphthalein solution R1* and titrate with 1 M *hydrochloric acid*. Carry out a blank test under the same conditions.

1 ml of 1 M *sodium hydroxide* is equivalent to 92.1 mg of C₁₂H₂₀O₇.

STORAGE

Store in an airtight container.

IMPURITIES

A. triethyl propene-1,2,3-tricarboxylate (triethyl aconitate).

01/2005:0059

TRIFLUOPERAZINE HYDROCHLORIDE

Trifluoperazini hydrochloridum

C₂₁H₂₆Cl₂F₃N₃S

M_r 480.4

DEFINITION

Trifluoperazine hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 10-[3-(4-methylpiperazin-1-yl)propyl]-2-(trifluoromethyl)-10H-phenothiazine dihydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white to pale yellow, crystalline powder, hygroscopic, freely soluble in water, soluble in alcohol.

It melts at about 242 °C, with decomposition.

IDENTIFICATION

- Protect the solutions from bright light and measure the absorbances immediately.* Dissolve 50 mg in 0.1 M *hydrochloric acid* and dilute to 500 ml with the same acid. Examined between 280 nm and 350 nm, the solution shows an absorption maximum (2.2.25) at 305 nm. Dilute 5 ml of the solution to 100 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 280 nm, this solution shows an absorption maximum at 255 nm. The specific absorbance at this maximum is about 650.
- It complies with the identification test for phenothiazines by thin-layer chromatography (2.3.3).
- Place 0.25 g in a 100 ml separating funnel, add 5 ml of *water R* and 2 ml of *dilute sodium hydroxide solution R*. Shake vigorously with 20 ml of *ether R*. Wash the ether layer with 5 ml of *water R*, add 0.15 g of *maleic acid R* and evaporate the ether. The residue, recrystallised from 30 ml of *alcohol R* and dried, melts (2.2.14) at about 192 °C.
- Dissolve about 0.5 mg in 1 ml of *water R*, add 0.1 ml of *bromine water R* and shake for about 1 min. Add dropwise 1 ml of *sulphuric acid R* with constant, vigorous agitation. A red colour develops.
- Dissolve about 50 mg in 5 ml of *water R* and add 2 ml of *nitric acid R*. A dark-red colour develops which turns to pale yellow. The solution gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3). Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent. The pH of the solution is 1.6 to 2.5.

Related substances. Carry out the test protected from bright light.

Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel GF₂₅₄ plate R*.

Test solution. Dissolve 0.2 g of the substance to be examined in a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R* and dilute to 10 ml with the same mixture of solvents. Prepare immediately before use.

Reference solution. Dilute 1 ml of the test solution to 200 ml with a mixture of 5 volumes of *diethylamine R* and 95 volumes of *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *diethylamine R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 24.02 mg of $C_{10}H_7F_3O_4$.

STORAGE

Store in an airtight container, protected from light.

TRIFLUSAL

Triflusalum

$C_{10}H_7F_3O_4$

M_r 248.2

DEFINITION

2-(Acetyloxy)-4-(trifluoromethyl)benzoic acid.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder.

Solubility: practically insoluble in water, very soluble in ethanol, freely soluble in methylene chloride.

mp: about 118 °C, with decomposition.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: triflusal CRS.

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 0.20 g of the substance to be examined in *acetonitrile R* and dilute to 20.0 ml with the same solvent. *Prepare the solution immediately before use.*

Reference solution (a). Dissolve 5.0 mg of *triflusal impurity B CRS* in *acetonitrile R* and dilute to 10.0 ml with the same solvent.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 25.0 ml with *acetonitrile R*.

Reference solution (c). Dissolve 2.5 mg of the substance to be examined in *acetonitrile R*, add 5 ml of reference solution (a) and dilute to 10 ml with *acetonitrile R*. *Prepare the solution immediately before use.*

Column:

– size: $l = 0.15$ m, $\varnothing = 4.0$ mm,

– *stationary phase:* octadecylsilyl silica gel for chromatography *R* (4–5 μ m).

Mobile phase:

– *mobile phase A:* acetonitrile *R*,

– *mobile phase B:* 0.5 per cent V/V solution of *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 20	20 → 70	80 → 30
20 - 25	70	30
25 - 26	70 → 20	30 → 80
26 - 30	20	80

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 237 nm.

Injection: 10 μ l of the test solution and reference solutions (b) and (c).

Relative retention with reference to triflusal (retention time = about 13 min): *impurity A* = about 0.3; *impurity B* = about 1.2; *impurity C* = about 1.3; *impurity D* = about 1.6.

System suitability: reference solution (c):

– **resolution:** minimum 3.0 between the peaks due to triflusal and *impurity B*.

Limits:

– **impurity B:** not more than 1.5 times the area of the corresponding peak in the chromatogram obtained with reference solution (b) (0.3 per cent),

– **total of impurities other than B:** not more than 0.5 times the area of the peak due to *impurity B* in the chromatogram obtained with reference solution (b) (0.1 per cent),

– **disregard limit:** 0.1 times the area of the peak due to *impurity B* in the chromatogram obtained with reference solution (b) (0.02 per cent).

Heavy metals (2.4.8): maximum 10 ppm.

Dissolve 2.0 g in 12 ml of *alcohol R* and dilute to 20 ml with *water R*. 12 ml complies with limit test B. Prepare the standard using lead standard solution (1 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 2 volumes of *water R* and 3 volumes of *alcohol R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in a desiccator *in vacuo* over *diphosphorus pentoxide R*.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g in a platinum crucible.

ASSAY

Dissolve 0.200 g in 50 ml of *ethanol R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 24.82 mg of $C_{10}H_7F_3O_4$.

STORAGE

In an airtight container, at a temperature not exceeding 25 °C.

IMPURITIES

Specified impurities: B.

Other detectable impurities: A, C, D.

- A. R1 = H, R2 = CO-CH₃, R4 = CO₂H: 2-(acetyloxy)benzene-1,4-dicarboxylic acid (2-acetoxyterephthalic acid),
- B. R1 = R2 = H, R4 = CF₃: 2-hydroxy-4-(trifluoromethyl)benzoic acid (4-(trifluoromethyl)salicylic acid),
- C. R1 = R2 = CO-CH₃, R4 = CF₃: acetic 2-(acetyloxy)-4-(trifluoromethyl)benzoic anhydride,

- D. 2-[[2-(acetyloxy)-4-(trifluoromethyl)benzoyl]oxy]-4-(trifluoromethyl)benzoic acid.

01/2005:0868

TRIGLYCERIDES, MEDIUM-CHAIN

Triglycerida saturata media

DEFINITION

Mixture of triglycerides of saturated fatty acids, mainly of caprylic acid (octanoic acid, C₈H₁₆O₂) and of capric acid (decanoic acid, C₁₀H₂₀O₂). Medium-chain triglycerides are obtained from the oil extracted from the hard, dried fraction of the endosperm of *Cocos nucifera* L. or from the dried endosperm of *Elaeis guineensis* Jacq.

Content: minimum 95.0 per cent of saturated fatty acids with 8 and 10 carbon atoms.

CHARACTERS

Appearance: colourless or slightly yellowish, oily liquid.

Solubility: practically insoluble in water, miscible with alcohol, with methylene chloride, with light petroleum and with fatty oils.

IDENTIFICATION

First identification: B, C.

Second identification: A, D.

- A. Heat 3.0 g under a reflux condenser for 30 min with 50 ml of a mixture of equal volumes of *alcohol R* and 2 M *alcoholic potassium hydroxide R*. Reserve 10 ml of the mixture for identification test D. To 40 ml of the mixture add 30 ml of *water R*, evaporate the alcohol and acidify the hot solution with 25 ml of *dilute hydrochloric acid R*. After cooling, shake with 50 ml of *peroxide-free ether R*. Wash the ether layer with 3 quantities, each of 10 ml, of *sodium chloride solution R*, dry over *anhydrous sodium sulphate R* and filter. Evaporate the ether and determine the acid value (2.5.1) of the residue, using 0.300 g. The acid value is 350 to 390.
- B. It complies with the test for saponification value (see Tests).
- C. It complies with the test for composition of fatty acids (see Tests).

- D. Evaporate 10 ml of the alcoholic mixture obtained in identification test A to dryness on a water-bath. Transfer the residue into a test-tube, add 0.3 ml of *sulphuric acid R* and close the test-tube with a stopper through which a U-shaped glass tube is inserted. One end of the U-tube is dipped into 3 ml of a 10 g/l solution of *tryptophan R* in a mixture of equal volumes of *sulphuric acid R* and *water R*. Heat the test-tube in a silicone-oil bath at 180 °C for 10 min and collect the liberated fumes in the tryptophan reagent. Heat the tryptophan reagent on a water-bath for 1 min. A violet colour develops.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution Y₃ (2.2.2, *Method I*).

Alkaline impurities. Dissolve 2.00 g in a mixture of 1.5 ml of *alcohol R* and 3.0 ml of *ether R*. Add 0.05 ml of *bromophenol blue solution R*. Not more than 0.15 ml of 0.01 M *hydrochloric acid* is required to change the colour of the indicator to yellow.

Relative density (2.2.5): 0.93 to 0.96.

Refractive index (2.2.6): 1.440 to 1.452.

Viscosity (2.2.9): 25 mPas to 33 mPas.

Acid value (2.5.1): maximum 0.2.

Hydroxyl value (2.5.3, *Method A*): maximum 10.

Iodine value (2.5.4): maximum 1.0.

Peroxide value (2.5.5, *Method A*): maximum 1.0.

Saponification value (2.5.6): 310 to 360.

Unsaponifiable matter (2.5.7): maximum 0.5 per cent, determined on 5.0 g.

Composition of fatty acids. Gas chromatography (2.4.22, *Method C*).

Column:

- **material:** fused silica,
- **size:** *l* = 30 m, Ø = 0.32 mm,
- **stationary phase:** *macrogol 20 000 R* (film thickness 0.5 µm),

Carrier gas: *helium for chromatography R*.

Flow rate: 1.3 ml/min.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	70
	1 - 35	70 → 240
	35 - 50	240
Injection port		250
Detector		250

Detection: flame ionisation.

Split ratio: 1:100.

Composition of the fatty acid fraction of the substance:

- **caproic acid:** maximum 2.0 per cent,
- **caprylic acid:** 50.0 per cent to 80.0 per cent,
- **capric acid:** 20.0 per cent to 50.0 per cent,
- **lauric acid:** maximum 3.0 per cent,
- **myristic acid:** maximum 1.0 per cent.

Chromium: maximum 0.05 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *chromium liposoluble standard solution (1000 ppm Cr) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 0.5 ml, 1.0 ml and 2.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: chromium hollow-cathode lamp.

Wavelength: 357.8 nm.

Atomic generator: graphite furnace.

Carrier gas: argon R.

Copper: maximum 0.1 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (2.2.23, Method II).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *copper liposoluble standard solution (1000 ppm Cu) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: copper hollow-cathode lamp.

Wavelength: 324.7 nm.

Atomic generator: graphite furnace.

Carrier gas: argon R.

Lead: maximum 0.1 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (2.2.23, Method II).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *lead liposoluble standard solution (1000 ppm Pb) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: lead hollow-cathode lamp.

Wavelength: 283.3 nm.

Atomic generator: graphite furnace coated inside with palladium carbide; calcination is carried out in the presence of oxygen at a temperature below 800 °C.

Carrier gas: argon R.

Nickel: maximum 0.2 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (2.2.23, Method II).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *nickel liposoluble standard solution (1000 ppm Ni) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: nickel hollow-cathode lamp.

Wavelength: 232 nm.

Atomic generator: graphite furnace.

Carrier gas: argon R.

Tin: maximum 0.1 ppm, if intended for use in parenteral nutrition.

Atomic absorption spectrometry (2.2.23, Method II).

Test solution. Dissolve 2.0 g of the substance to be examined in *methyl isobutyl ketone R3* and dilute to 10.0 ml with the same solvent.

Solution A. Dilute 0.100 ml of *tin liposoluble standard solution (1000 ppm Sn) R* to 10.0 ml with *methyl isobutyl ketone R3*.

Stock solution. Dilute 0.100 ml of solution A to 10.0 ml with *methyl isobutyl ketone R3*.

Reference solutions. Prepare 3 reference solutions by dissolving for each 2.0 g of the substance to be examined in the minimum volume of *methyl isobutyl ketone R3*, adding 1.0 ml, 2.0 ml and 4.0 ml, respectively, of stock solution and diluting to 10.0 ml with *methyl isobutyl ketone R3*.

Source: tin hollow-cathode lamp.

Wavelength: 286.3 nm.

Atomic generator: graphite furnace coated inside with palladium carbide.

Carrier gas: argon R.

Heavy metals (2.4.8): maximum 10 ppm, if intended for use other than parenteral nutrition.

2.0 g complies with limit test D. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12): maximum 0.2 per cent, determined on 10.00 g.

Total ash (2.4.16): maximum 0.1 per cent, determined on 2.0 g.

STORAGE

In a well-filled container, protected from light.

LABELLING

The label states, where applicable, that the substance is intended for use in parenteral nutrition.

01/2005:1626

TRIHEXYPHENIDYL HYDROCHLORIDE

Trihexyphenidyli hydrochloridum

C₂₀H₃₂ClNOM_r 337.9

DEFINITION

(1*RS*)-1-Cyclohexyl-1-phenyl-3-(piperidin-1-yl)propan-1-ol hydrochloride.

Content: 99.0 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder.

Solubility: slightly soluble in water, sparingly soluble in alcohol and in methylene chloride.

mp: about 250 °C, with decomposition.

IDENTIFICATION

First identification: A, D.

Second identification: B, C, D.

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: trihexyphenidyl hydrochloride CRS.

B. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 25 mg of the substance to be examined in a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Reference solution. Dissolve 25 mg of *trihexyphenidyl hydrochloride CRS* in a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R* and dilute to 10 ml with the same mixture of solvents.

Plate: TLC silica gel G plate R.

Mobile phase: diethylamine R, hexane R (5:95 V/V).

Application: 5 µl.

Development: over 2/3 of the plate.

Drying: in air.

Detection: spray with a 0.1 g/l solution of *chloroplatinic acid R* in *hydrochloric acid R* containing 0.4 per cent V/V of *hydriodic acid R*.

Results: the principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

C. Dissolve 0.5 g in 5 ml of warm *methanol R* and make just alkaline to *red litmus paper R* with *sodium hydroxide solution R*. A precipitate is formed which, after recrystallisation from *methanol R*, melts (2.2.14) at about 113 °C to 115 °C.

D. It gives reaction (a) of chlorides (2.3.1).

TESTS

pH (2.2.3): 5.2 to 6.2.

Dissolve 0.5 g with heating in 25 ml of *carbon dioxide-free water R*. Cool to room temperature and dilute to 50 ml with *carbon dioxide-free water R*.

Optical rotation (2.2.7): −0.10° to +0.10°.

Dissolve 1.25 g in a mixture of 20 volumes of *methanol R* and 80 volumes of *methylene chloride R* and dilute to 25.0 ml with the same mixture of solvents.

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 20.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase. Dilute 10.0 ml to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *trihexyphenidyl impurity A CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (c). Dilute 1.0 ml of reference solution (b) to 100.0 ml with the mobile phase.

Reference solution (d). To 1 ml of reference solution (b), add 1 ml of the test solution and dilute to 100 ml with the mobile phase.

Column:

- size: *l* = 0.15 m, Ø = 4.6 mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 200 ml of *water R* with 0.2 ml of *triethylamine R*. Adjust to pH 4.0 with *phosphoric acid R* and add 800 ml of *acetonitrile R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 210 nm.

Injection: 20 µl.

Run time: 3 times the retention time of trihexyphenidyl.

System suitability: reference solution (d):

- resolution: minimum 4.0 between the peaks corresponding to trihexyphenidyl and to impurity A.

Limits:

- impurity A: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- any other impurity: not more than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent),
- total: not more than 0.5 per cent,
- disregard limit: 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent).

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *alcohol R* and add 5.0 ml of 0.01 M *hydrochloric acid*. Carry out a potentiometric titration (2.2.20), using 0.1 M *sodium hydroxide*. Read the volume added between the 2 points of inflexion.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 33.79 mg of C₂₀H₃₂ClNO.

IMPURITIES

A. 1-phenyl-3-(piperidin-1-yl)propan-1-one.

01/2005:1741 Flow rate: 1.2 ml/min.

TRIMETAZIDINE DIHYDROCHLORIDE

Trimetazidini dihydrochloridum

 $C_{14}H_{24}Cl_2N_2O_3$ M_r 339.3**DEFINITION**

1-(2,3,4-Trimethoxybenzyl)piperazine dihydrochloride.

Content: 98.5 per cent to 101.5 per cent (dried substance).**CHARACTERS***Appearance*: white or almost white, crystalline powder, slightly hygroscopic.*Solubility*: freely soluble in water, sparingly soluble in alcohol.**IDENTIFICATION**

A. Infrared absorption spectrophotometry (2.2.24).

Comparison: Ph. Eur. reference spectrum of trimetazidine dihydrochloride.B. Dissolve 25 mg in 5 ml of *water R*. 2 ml of the solution gives reaction (a) of chlorides (2.3.1).**TESTS****Appearance of solution.** The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, *Method II*).Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent.**Related substances.** Liquid chromatography (2.2.29).*Test solution.* Dissolve 0.200 g of the substance to be examined in *water R* and dilute to 50.0 ml with the same solvent.*Reference solution (a).* Dissolve 20.0 mg of trimetazidine for system suitability CRS in *water R* and dilute to 5.0 ml with the same solvent.*Reference solution (b).* Dilute 2.0 ml of the test solution to 100.0 ml with *water R*. Dilute 5.0 ml of this solution to 100.0 ml with *water R*.*Reference solution (c).* Dilute 25.0 ml of reference solution (b) to 50.0 ml with *water R*.*Column*:

- *size*: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- *stationary phase*: spherical octadecylsilyl silica gel for chromatography *R* (5 μ m) with a pore size of 10 nm,
- *temperature*: 30 °C.

Mobile phase:

- *mobile phase A*: mix 357 volumes of *methanol R* and 643 volumes of a 2.87 g/l solution of sodium heptanesulphonate *R* adjusted to pH 3.0 with dilute phosphoric acid *R*,
- *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 50	95 → 75	5 → 25
50 - 52	75 → 95	25 → 5

Detection: spectrophotometer at 240 nm.*Equilibration*: for at least 1 h with the mobile phase at the initial composition.*Injection*: 10 μ l.

Relative retention with reference to trimetazidine (retention time = about 25 min): impurity D = about 0.2; impurity C = about 0.4; impurity H = about 0.6; impurities A and I = about 0.9; impurity E = about 0.95; impurity F = about 1.4; impurity B = about 1.8.

System suitability:

- *peak-to-valley ratio*: minimum 3, where H_p = height above the baseline of the peak due to impurity E and H_v = height above the baseline of the lowest point of the curve separating this peak from the principal peak in the chromatogram obtained with reference solution (a);
- *signal-to-noise ratio*: minimum 10 for the principal peak in the chromatogram obtained with reference solution (c).

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.55; impurity C = 0.37; impurity F = 0.71;
- *impurities A, B, C, D, E, F, H, I*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *any other impurity*: for each impurity, not more than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent);
- *total*: not more than twice the area of the principal peak in the chromatogram obtained with reference solution (b) (0.2 per cent);
- *disregard limit*: area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Impurity G. Thin-layer chromatography (2.2.27).*Test solution.* Dissolve 0.10 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.*Reference solution.* Dissolve 22.6 mg of piperazine hydrate *R* in *methanol R* and dilute to 100 ml with the same solvent. Dilute 10 ml of the solution to 100 ml with *methanol R*.*Plate*: TLC silica gel plate *R*.*Mobile phase*: concentrated ammonia *R*, alcohol *R* (20:80 V/V).*Application*: 10 μ l.*Development*: over 2/3 of the plate.*Drying*: at 100-105 °C for 30 min.*Detection*: spray with iodoplatinate reagent *R*.*Limit*:

- *impurity G*: any spot due to impurity G is not more intense than the spot in the chromatogram obtained with the reference solution (0.1 per cent, expressed as anhydrous piperazine).

Loss on drying (2.2.32): maximum 2.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C over diphosphorus pentoxide *R* at a pressure not exceeding 15 kPa.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.120 g in 50.0 ml of *water R*. Add 1 ml of *nitric acid R* and titrate with 0.1 M *silver nitrate*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *silver nitrate* is equivalent to 16.96 mg of $C_{14}H_{24}Cl_2N_2O_3$.

STORAGE

In an airtight container.

IMPURITIES

Specified impurities: A, B, C, D, E, F, G, H, I.

A. $R_1 = R_4 = H$, $R_2 = R_3 = OCH_3$: 1-(3,4,5-trimethoxybenzyl)piperazine,

E. $R_1 = R_3 = OCH_3$, $R_2 = R_4 = H$: 1-(2,4,5-trimethoxybenzyl)piperazine,

F. $R_1 = R_4 = OCH_3$, $R_2 = R_3 = H$: 1-(2,4,6-trimethoxybenzyl)piperazine,

B. 1,4-bis(2,3,4-trimethoxybenzyl)piperazine,

C. $R = CHO$: 2,3,4-trimethoxybenzaldehyde,

D. $R = CH_2OH$: (2,3,4-trimethoxyphenyl)methanol,

G. piperazine,

H. $R = COOC_2H_5$: ethyl 4-(2,3,4-trimethoxybenzyl)piperazine-1-carboxylate,

I. $R = CH_3$: 1-methyl-4-(2,3,4-trimethoxybenzyl)piperazine (*N*-methyltrimetazidine).

DEFINITION

Trimethadione contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of 3,5,5-trimethyloxazolidine-2,4-dione, calculated with reference to the dried substance.

CHARACTERS

Colourless or almost colourless crystals, soluble in water, very soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Melting point (2.2.14): 45 °C to 47 °C, determined without previous drying.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *trimethadione CRS*. Examine the substances prepared as discs using 3 mg of the substance to be examined and of the reference substance, respectively, in 0.4 g of *potassium bromide R*.

C. To 2 ml of solution S (see Tests) add 1 ml of *barium hydroxide solution R*. A white precipitate is formed, which dissolves on addition of 1 ml of *dilute hydrochloric acid R*.

D. Dissolve 0.3 g in a mixture of 5 ml of *alcoholic potassium hydroxide solution R* and 5 ml of *alcohol R* and allow to stand for 10 min. Add 0.05 ml of *phenolphthalein solution R1* and neutralise carefully with *hydrochloric acid R*. Evaporate to dryness on a water-bath and shake the residue with four quantities, each of 5 ml, of *ether R*. Filter the combined ether layers and evaporate to dryness. The residue, recrystallised from 5 ml of *toluene R* and dried, melts (2.2.14) at about 80 °C.

TESTS

Solution S. Dissolve 2.0 g in *carbon dioxide-free water R* and dilute to 40 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 10 ml of solution S add 0.1 ml of *methyl red solution R*. Not more than 0.1 ml of 0.01 M *hydrochloric acid* or 0.01 M *sodium hydroxide* is required to change the colour of the indicator.

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution* (1 ppm Pb) *R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.00 g by drying in a desiccator over *anhydrous silica gel R* for 6 h.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

01/2005:0440

TRIMETHADIONE

Trimethadionum

$C_6H_9NO_3$

M_r 143.1

ASSAY

Examine by gas chromatography (2.2.28), using *decanol R* as the internal standard.

Internal standard solution. Dissolve 0.125 g of *decanol R* in *ethanol R* and dilute to 25 ml with the same solvent.

Test solution. Dissolve 0.100 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the same solution.

Reference solution. Dissolve 0.100 g of *trimethadione CRS* in the internal standard solution and dilute to 10.0 ml with the same solution.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.75 m long and 3 mm in internal diameter packed with *styrene-divinylbenzene copolymer R* (125 µm to 150 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 20 ml/min,
- a flame-ionisation detector.

Maintain the temperature of the column at 210 °C, that of the injection port at 240 °C, and that of the detector at 270 °C. Inject 1 µl of each solution.

STORAGE

Store protected from light.

01/2005:0060

TRIMETHOPRIM

Trimethoprimum

C₁₄H₁₈N₄O₃

M_r 290.3

DEFINITION

5-(3,4,5-Trimethoxybenzyl)pyrimidine-2,4-diamine.

Content: 98.5 per cent to 101.0 per cent (dried substance).

CHARACTERS

Appearance: white or yellowish-white powder.

Solubility: very slightly soluble in water, slightly soluble in alcohol.

IDENTIFICATION

First identification: C.

Second identification: A, B, D.

- A. Melting point (2.2.14): 199 °C to 203 °C.
- B. Dissolve about 20 mg in 0.1 M sodium hydroxide and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with 0.1 M sodium hydroxide. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 287 nm. The specific absorbance at the maximum is 240 to 250.
- C. Infrared absorption spectrophotometry (2.2.24).
Preparation: discs.
Comparison: trimethoprim CRS.
- D. Dissolve about 25 mg, heating if necessary, in 5 ml of 0.005 M sulphuric acid and add 2 ml of a 16 g/l solution of potassium permanganate R in 0.1 M sodium hydroxide. Heat to boiling and add to the hot solution 0.4 ml of formaldehyde R. Mix, add 1 ml of 0.5 M sulphuric acid, mix and heat again to boiling. Cool and filter. To the filtrate add 2 ml of methylene chloride R and shake vigorously. The organic layer, examined in ultraviolet light at 365 nm, shows green fluorescence.

TESTS

Appearance of solution. The solution is not more intensely coloured than reference solution BY₇ (2.2.2, Method II).

Dissolve 0.5 g in 10 ml of a mixture of 1 volume of water R, 4.5 volumes of methanol R and 5 volumes of methylene chloride R.

Related substances

A. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of trimethoprim CRS and 2.5 mg of trimethoprim impurity E CRS in the mobile phase and dilute to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.250 m, Ø = 4.0 mm,
- *stationary phase*: base-deactivated octadecylsilyl silica gel for chromatography R (5 µm).

Mobile phase: mix 30 volumes of methanol R and 70 volumes of a 1.4 g/l solution of sodium perchlorate R adjusted to pH 3.6 with phosphoric acid R.

Flow rate: 1.3 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl loop injector.

Run time: 11 times the retention time of trimethoprim.

Relative retentions with reference to trimethoprim (retention time = about 5 min): impurity C = about 0.8; impurity E = about 0.9; impurity A = about 1.5; impurity D = about 2.0; impurity G = about 2.1; impurity B = about 2.3; impurity J = about 2.7; impurity F = about 4.0.

System suitability: reference solution (b):

- *resolution*: minimum of 2.5 between the peaks.

Limits:

- *correction factors*: for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity B = 0.43; impurity E = 0.53; impurity J = 0.66;
- *any impurity*: not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- *total*: not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- *disregard limit*: 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent); disregard any peak corresponding to impurity H (relative retentions = about 10.3).

B. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dilute 1.0 ml of the test solution to 200.0 ml with the mobile phase.

Reference solution (b). Dissolve 5.0 mg of trimethoprim CRS and 5.0 mg of trimethoprim impurity B CRS in the mobile phase and dilute to 100.0 ml with the mobile phase.

Column:

- *size*: *l* = 0.250 m, Ø = 4.6 mm,
- *stationary phase*: nitrile silica gel for chromatography R (5 µm) with a specific surface area of 350 m²/g and a pore diameter of 10 nm.

Mobile phase: dissolve 1.14 g of *sodium hexane sulphonate R* in 600 ml of a 13.6 g/l solution of *potassium dihydrogen phosphate R*; adjust to pH 3.1 using *phosphoric acid R* and mix with 400 volumes of *methanol R*.

Flow rate: 0.8 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 20 µl loop injector.

Run time: 6 times the retention time of trimethoprim.

Relative retentions with reference to trimethoprim (retention time = about 4 min): impurity H = about 1.8; impurity I = about 4.9.

System suitability: reference solution (b):

- **resolution:** minimum of 2.0 between the peaks.

Limits:

- **correction factors:** for the calculation of contents, multiply the peak areas of the following impurities by the corresponding correction factor: impurity H = 0.50; impurity I = 0.28;
- **any impurity:** not more than 0.2 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.1 per cent);
- **total:** not more than 0.4 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.2 per cent);
- **disregard limit:** 0.04 times the area of the principal peak in the chromatogram obtained with reference solution (a) (0.02 per cent); disregard any peak corresponding to impurity B (relative retention = about 1.3).

Impurity K. Gas chromatography (2.2.28).

Test solution. Dissolve 0.500 g of the substance to be examined in 35.0 ml of *citrate buffer solution pH 5.0 R*, add 10.0 ml of *1,1-dimethylethyl methyl ether R*, shake thoroughly and centrifuge for 10 min. Use the upper layer.

Reference solution. Dilute 5.0 ml of *hydrochloric acid R* to 50.0 ml with *water R*. Add 12.5 mg of *aniline R* and shake thoroughly (solution A). To 35.0 ml of *citrate buffer solution pH 5.0 R* add 10.0 µl of solution A and 10.0 ml of *1,1-dimethylethyl methyl ether R*, shake thoroughly and centrifuge for 10 min. Use the upper layer.

Column:

- **material:** fused silica,
- **size:** $l = 30$ m, $\varnothing = 0.53$ mm,
- **stationary phase:** *poly(dimethyl)siloxane R* (film thickness 3 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 12 ml/min.

Temperature:

- **column:** 80 °C,
- **injection port:** 230 °C,
- **detector:** 270 °C.

Detection: nitrogen-phosphorus detector.

Injection: 3 µl.

Run time: 15 min.

System suitability: reference solution:

- **repeatability:** maximum relative standard deviation of 5.0 per cent after 6 injections.

Limit:

- **impurity K:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (5 ppm).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 29.03 mg of $C_{14}H_{18}N_4O_3$.

IMPURITIES

By liquid chromatography A: A, B, C, D, E, F, G, H, I.

By liquid chromatography B: B, H, I.

By gas chromatography: K.

A. *N*²-methyl-5-(3,4,5-trimethoxybenzyl)pyrimidine-2,4-diamine,

and enantiomer

B. $R + R' = O$: (2,4-diaminopyrimidin-5-yl)(3,4,5-trimethoxyphenyl)methanone,

C. $R = OH$, $R' = H$: (*RS*)-(2,4-diaminopyrimidin-5-yl)(3,4,5-trimethoxyphenyl)methanol,

D. $R_2 = NH_2$, $R_4 = OH$: 2-amino-5-(3,4,5-trimethoxybenzyl)pyrimidin-4-ol,

E. $R_2 = OH$, $R_4 = NH_2$: 4-amino-5-(3,4,5-trimethoxybenzyl)pyrimidin-2-ol,

F. $R_3 = Br$, $R_4 = OCH_3$: 5-(3-bromo-4,5-dimethoxybenzyl)pyrimidine-2,4-diamine,

G. $R_3 = OCH_3$, $R_4 = OC_2H_5$: 5-(4-ethoxy-3,5-dimethoxybenzyl)pyrimidine-2,4-diamine,

H. R = CH₃: methyl 3,4,5-trimethoxybenzoate,

J. R = H: 3,4,5-trimethoxybenzoic acid,

I. 3-(phenylamino)-2-(3,4,5-trimethoxybenzyl)prop-2-enitrile,

K. aniline.

01/2005:0534

TRIMIPRAMINE MALEATE

Trimipramini maleas

and enantiomer ,

C₂₄H₃₀N₂O₄

M_r 410.5

DEFINITION

Trimipramine maleate contains not less than 98.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-3-(10,11-dihydro-5*H*-dibenzo[*b,f*]azepin-5-yl)-*N,N*,2-trimethylpropan-1-amine (*Z*)-but-2-enedioate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water and in alcohol.

IDENTIFICATION

First identification: A, C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 140 °C to 144 °C.

B. Dissolve 40.0 mg in 0.01 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of the solution to 100.0 ml with 0.01 *M* hydrochloric acid. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 250 nm and a shoulder at 270 nm. The specific absorbance at the maximum is 205 to 235.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with trimipramine maleate CRS.

D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

E. Examine by thin-layer chromatography (2.2.27), using silica gel GF₂₅₄ R as the coating substance.

Test solution. Dissolve 0.20 g of the substance to be examined in methanol R and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 56 mg of maleic acid R in methanol R and dilute to 10 ml with the same solvent.

Apply to the plate as 10 mm bands 5 µl of each solution. Develop over a path of 12 cm using a mixture of 3 volumes of water R, 7 volumes of anhydrous formic acid R and 90 volumes of di-isopropyl ether R. Dry the plate in a current of air for a few minutes and then at 120 °C for 10 min and examine in ultraviolet light at 254 nm. The chromatogram obtained with the test solution shows a zone on the starting line and another zone which is similar in position and size to the principal zone in the chromatogram obtained with the reference solution.

TESTS

Appearance of solution. Dissolve 2.5 g in chloroform R and dilute to 25 ml with the same solvent. The solution is not more intensely coloured than reference solution BY₅ (2.2.2, Method II).

Related substances. Examine by thin-layer chromatography (2.2.27), using silica gel G R as the coating substance.

Test solution (a). Dissolve 0.50 g of the substance to be examined in methanol R and dilute to 10 ml with the same solvent. Prepare immediately before use.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with methanol R.

Reference solution (a). Dissolve 25 mg of trimipramine maleate CRS in methanol R and dilute to 10 ml with the same solvent. Prepare immediately before use.

Reference solution (b). Dilute 1 ml of reference solution (a) to 10 ml with methanol R.

Reference solution (c). Dilute 1 ml of reference solution (a) to 25 ml with methanol R.

Reference solution (d). Dissolve 10 mg of iminodibenzyl R in methanol R and dilute to 100 ml with the same solvent. Prepare immediately before use.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 0.7 volumes of concentrated ammonia R, 10 volumes of ethanol R and 90 volumes of toluene R. Allow the plate to dry in air for 15 min, spray with a 5 g/l solution of potassium dichromate R in a mixture of 1 volume of sulphuric acid R and 4 volumes of water R and examine immediately. In the chromatogram obtained with test solution (a): any spot corresponding to iminodibenzyl is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.2 per cent); any spot, apart from the principal spot and the spot corresponding to iminodibenzyl, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most three such spots are more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). Disregard any spot at the starting point.

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 4 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.3500 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid* determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 41.05 mg of C₂₄H₃₀N₂O₄.

STORAGE

Store protected from light.

01/2005:1682

TRI-*n*-BUTYL PHOSPHATE

Tri-*n*-butylis phosphas

C₁₂H₂₇O₄P

M_r 266.3

CHARACTERS

Appearance: clear, colourless to pale yellow liquid.

Solubility: slightly soluble in water, miscible with alcohol.

bp: about 289 °C, with decomposition.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *tri-n-butyl phosphate CRS*.

TESTS

Appearance. The substance to be examined is clear (2.2.1) and not more intensely coloured than reference solution Y₆ (2.2.2, *Method II*).

Acidity. Dissolve 50 ml in 50 ml of *alcohol R* previously adjusted with 0.02 M *potassium hydroxide* or 0.02 M *hydrochloric acid* to a bluish-green colour, using 0.5 ml of *bromothymol blue solution R1* as indicator. Titrate with 0.02 M *potassium hydroxide* to (the initial) bluish-green coloration. Not more than 0.8 ml are required.

Related substances. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. Substance to be examined.

Reference solution. Dissolve 10 mg of the substance to be examined and 10 mg of *methyl myristate R* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Column:

- **material:** fused silica,
- **size:** *l* = 30 m, Ø = 0.32 mm,
- **stationary phase:** *poly(dimethyl)siloxane R* (5 µm).

Carrier gas: *helium for chromatography R*.

Linear velocity: 32 cm/s.

Split-ratio: 65:1.

Temperature:

- **column:** 250 °C,
- **injection port and detector:** 250 °C.

Detector: flame ionisation.

Injection: 1 µl.

Run time: twice the retention time of *tri-n-butyl phosphate*.

System suitability: reference solution:

- **resolution:** minimum 10 between the peaks due to *tri-n-butyl phosphate* and *methyl myristate*.

Limits:

- **any impurity:** maximum 0.1 per cent,
- **total:** maximum 0.3 per cent,
- **disregard limit:** 0.01 per cent.

Chlorides (2.4.4): maximum 200 ppm.

Dissolve 0.25 g in 15 ml of *alcohol (70 per cent V/V) R*. The solution complies with the limit test for chlorides. Prepare the reference solution with 10 ml of *chloride standard solution (5 ppm Cl) R* and 5 ml of *ethanol R*.

Heavy metals (2.4.8): maximum 20 ppm.

Dissolve 2.0 g in 13 ml of *alcohol R* and dilute to 20.0 ml with *water R*. 12 ml of the solution complies with limit test B. Prepare the standard using *lead standard solution (2 ppm Pb)* prepared by diluting *lead standard solution (100 ppm Pb) R* with a mixture of 5 volumes of *water R* and 13 volumes of *alcohol R*.

Water (2.5.32): maximum 0.1 per cent, determined on 1.0 g.

STORAGE

Protected from light.

IMPURITIES

- R1 = R2 = [CH₂]₃-CH₃, R3 = H: dibutyl hydrogen phosphate,

TROLAMINE**Trolaminum** $C_6H_{15}NO_3$ M_r 149.2**DEFINITION**

2,2',2''-Nitrilotriethanol.

Content: 99.0 per cent *m/m* to 103.0 per cent *m/m* of total bases (anhydrous substance).**CHARACTERS***Appearance*: clear, viscous, colourless or slightly yellow liquid, very hygroscopic.*Solubility*: miscible with water and with alcohol, soluble in methylene chloride.**IDENTIFICATION***First identification*: B, C.*Second identification*: A, B, D.

A. Relative density (2.2.5): 1.120 to 1.130.

B. Refractive index (2.2.6): 1.482 to 1.485.

C. Examine the chromatograms obtained in the test for related substances.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).D. To 1 ml add 0.3 ml of *copper sulphate solution R*. A blue colour develops. Add 2.5 ml of *dilute sodium hydroxide solution R* and heat to boiling. The blue colour remains unchanged.**TESTS****Solution S**. Dissolve 12 g in *water R* and dilute to 20 ml with the same solvent.**Appearance of solution**. Solution S is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).**Related substances**. Gas chromatography (2.2.28).*Internal standard solution*. Dissolve 5.0 g of 3-aminopropanol *R* in *water R* and dilute to 100.0 ml with the same solvent.*Test solution*. Dissolve 10.0 g of the substance to be examined in *water R*. Add 1.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.*Reference solution (a)*. Dissolve 1.0 g of trolamine CRS in *water R* and dilute to 10.0 ml with the same solvent.*Reference solution (b)*. Dissolve 1.0 g of *ethanolamine R*, 5.0 g of *diethanolamine R* and 1.0 g of trolamine CRS in *water R* and dilute to 100.0 ml with the same solvent. To 1.0 ml of the solution add 1.0 ml of the internal standard solution and dilute to 100.0 ml with *water R*.*Column*:

- *material*: fused silica,
- *size*: $l = 25$ m, $\varnothing = 0.25$ mm,
- *stationary phase*: poly(dimethyl)(diphenyl)siloxane *R* (film thickness 0.50 μ m).

Carrier gas: helium for chromatography *R*.

	Time (min)	Temperature (°C)
Column	0	60
	0 - 8.5	60 → 230
	8.5 - 14	230
Injection port		260
Detector		280

Detection: flame ionisation.*Injection*: 2 μ l; if necessary inject a blank.*Elution order*: impurity A, 3-aminopropanol, impurity B, trolamine.*System suitability*: reference solution (b):

- *resolution*: minimum 2 between the peaks due to 3-aminopropanol and impurity A.

Limits:

- *impurity A*: calculate the ratio R1 of the area of the peak due to impurity A to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak due to impurity A to the area of the peak due to the internal standard: this ratio is not greater than R1 (0.1 per cent),
- *impurity B*: calculate the ratio R2 of the area of the peak due to impurity B to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the area of any peak due to impurity B to the area of the peak due to the internal standard: this ratio is not greater than R2 (0.5 per cent),
- *total*: calculate the ratio R3 of the area of the peak due to trolamine to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b); from the chromatogram obtained with the test solution, calculate the ratio of the sum of the areas of any peaks, apart from the principal peak and the peak due to the internal standard, to the area of the peak due to the internal standard: this ratio is not greater than 10 times R3 (1.0 per cent),
- *disregard limit*: 0.5 times the ratio of the area of the peak due to trolamine to the area of the peak due to the internal standard from the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity C. Gas chromatography (2.2.28). Carry out the test under a ventilated hood, wear gloves and safety glasses.*Test solution*. In a suitable distillation apparatus mix 100.0 g of the substance to be examined and 100.0 ml of *ethylene glycol R* and gently distil 10.0 ml under vacuum at a pressure not exceeding 1.3 kPa. From this distillate, distil 1 ml.*Reference solution*. Dilute 25.0 mg of *N-nitrosodiethanolamine R* to 100.0 ml with *ethylene glycol R*. Dilute 5.0 ml of the solution to 50.0 ml with *ethylene glycol R*. Dilute 5.0 ml of this solution to 50.0 ml with *ethylene glycol R*.*Column*:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.25$ mm,
- *stationary phase*: macrogol 20 000 *R* (film thickness 0.25 μ m).

Carrier gas: helium for chromatography R.

Flow rate: 0.75 ml/min.

Split ratio: 1:15.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 2	180
	2 - 8	180 → 240
	8 - 25	240
Injection port		240
Detector		250

Detection: mass selective spectrometer set at 72 m/e or 91 m/e.

Injection: 3 µl; if necessary inject a blank between each injection.

Retention times: impurity C = about 20 min.

Limit:

- **impurity C:** not more than the area of the corresponding peak in the chromatogram obtained with the reference solution (25 ppb).

Heavy metals (2.4.8): maximum 10 ppm.

Dilute 5 ml of solution S to 30 ml with *water R*. The solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Water (2.5.12): maximum 1.0 per cent, determined on 1.000 g.

Open the titration vessel, introduce the substance to be examined directly into the previously titrated solvent. Stopper the flask immediately.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g. Do not carry out the initial heating on a water-bath.

ASSAY

Dissolve 1.200 g in 75 ml of *carbon dioxide-free water R*. Add 0.3 ml of *methyl red solution R*. Titrate with *1 M hydrochloric acid*.

1 ml of *1 M hydrochloric acid* is equivalent to 0.149 g of $C_4H_{11}NO_3$.

STORAGE

In an airtight container, protected from light.

IMPURITIES

- R = R' = H: 2-aminoethanol (ethanolamine),
- R = CH_2-CH_2OH , R' = H: 2,2'-iminodiethanol (diethanolamine),
- R = CH_2-CH_2OH , R' = NO: 2,2'-(nitrosoimino)diethanol (N-nitrosodiethanolamine).

TROMETAMOL

Trometamol

$C_4H_{11}NO_3$

M_r 121.1

DEFINITION

Trometamol contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of aminomethylidynetri(methanol), calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, or colourless crystals, freely soluble in water, sparingly soluble in alcohol, very slightly soluble in ethyl acetate.

IDENTIFICATION

First identification: B, C.

Second identification: A, B, D.

A. Solution S (see Tests) is strongly alkaline (2.2.4).

B. Melting point (2.2.14): 168 °C to 174 °C.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *trometamol CRS*.

D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of freshly prepared solution S is 10.0 to 11.5.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance. Wash the plate with *methanol R* before applying the solutions.

Test solution (a). Dissolve 0.20 g in 1 ml of *water R*, with heating, and dilute to 10 ml with *methanol R*.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *trometamol CRS* in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (a) to 100 ml with *methanol R*.

Apply to the plate 10 µl of each solution. Develop over a path of 10 cm using a mixture of 10 volumes of *dilute ammonia R1* and 90 volumes of *2-propanol R*. Dry the plate at 100 °C to 105 °C. Spray with a 5 g/l solution of *potassium permanganate R* in a 10 g/l solution of *sodium carbonate R*. After about 10 min examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (1.0 per cent).

Chlorides (2.4.4). To 10 ml of solution S add 2.5 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Heavy metals (2.4.8). Dissolve 2.0 g in 10 ml of *water R*. Neutralise the solution with *hydrochloric acid R1* and dilute to 20 ml with *water R*. 12 ml of the solution complies with limit test A for heavy metals (10 ppm). Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Iron (2.4.9). Dissolve 1.0 g in *water R* and dilute to 10 ml with the same solvent. The solution complies with the limit test for iron (10 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

Bacterial endotoxins (2.6.14): less than 0.03 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.100 g in 20 ml of *water R*. Add 0.2 ml of *methyl red solution R*. Titrate with 0.1 M *hydrochloric acid* until the colour changes from yellow to red.

1 ml of 0.1 M *hydrochloric acid* is equivalent to 12.11 mg of $C_{17}H_{20}NO_2$.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

A. nitromethylidynetri(methanol).

01/2005:1159

TROPICAMIDE

Tropicamidum

$C_{17}H_{20}N_2O_2$

M_r 284.4

DEFINITION

Tropicamide contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-*N*-ethyl-3-hydroxy-2-phenyl-*N*-(pyridin-4-ylmethyl)propanamide, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, slightly soluble in water, freely soluble in alcohol and in methylene chloride.

IDENTIFICATION

First identification: C.

Second identification: A, B, D, E.

A. Melting point (2.2.14): 95 °C to 98 °C.

B. Dissolve 20.0 mg in 0.1 M *hydrochloric acid* and dilute to 50.0 ml with the same acid. Dilute 2.0 ml of the solution to 20.0 ml with 0.1 M *hydrochloric acid*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 254 nm. The specific absorbance at the maximum is 170 to 190.

C. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tropicamide CRS*. Examine the substances prepared as discs.

D. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the spot in the chromatogram obtained with reference solution (a).

E. Dissolve about 5 mg in 3 ml of a mixture of 9 ml of *acetic anhydride R*, 1 ml of *acetic acid R* and 0.1 g of *citric acid R*. Heat on a water-bath for 5 min to 10 min. A reddish-yellow colour is produced.

TESTS

Appearance of solution. Dissolve 0.1 g in *alcohol R* and dilute to 10 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Optical rotation (2.2.7). Dissolve 2.5 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The angle of optical rotation is -0.1° to $+0.1^\circ$.

Related substances. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *methylene chloride R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 20 ml with *methylene chloride R*.

Reference solution (a). Dissolve 10 mg of *tropicamide CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dilute 1 ml of test solution (b) to 10 ml with *methylene chloride R*.

Reference solution (c). Dilute 2 ml of reference solution (b) to 5 ml with *methylene chloride R*.

Reference solution (d). Dissolve 20 mg of 4-[(ethylamino)methyl]pyridine *R* in *methylene chloride R* and dilute to 20 ml with the same solvent. Dilute 1 ml of the solution and 1 ml of reference solution (a) to 10 ml with *methylene chloride R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 0.5 volumes of *concentrated ammonia R*, 5 volumes of *methanol R* and 95 volumes of *methylene chloride R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent). The test is not valid unless the chromatogram obtained with reference solution (d) shows two clearly separated spots.

Tropic acid. To 10.0 mg add 5 mg of *disodium tetraborate R* and 0.35 ml of a freshly prepared 100 g/l solution of *dimethylaminobenzaldehyde R* in a mixture of 1 volume

of *water R* and 9 volumes of *sulphuric acid R*. Heat on a water-bath for 3 min. Cool in ice water and add 5 ml of *acetic anhydride R*. No violet-red colour develops (0.05 per cent).

Chlorides (2.4.4). Dissolve 1.0 g with heating in 8 ml of *acetic acid R*, cool and dilute to 10 ml with the same acid. Dilute 5 ml of the solution to 15 ml with *water R*. The solution complies with the limit test for chlorides (100 ppm).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 80 °C at a pressure not exceeding 0.7 kPa for 4 h.

Sulphated ash (2.2.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 50 ml of *anhydrous acetic acid R*. Add 0.2 ml of *naphtholbenzein solution R* and titrate with 0.1 M *perchloric acid* until the colour changes from orange to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 28.44 mg of $C_{17}H_{20}N_2O_2$.

STORAGE

Store protected from light.

IMPURITIES

A. *N*-(pyridin-4-ylmethyl)ethanamine,

B. *N*-ethyl-2-phenyl-*N*-(pyridin-4-ylmethyl)propenamide,

C. (2*RS*)-3-hydroxy-2-phenylpropanoic acid (tropic acid).

01/2005:0694

TRYPSIN

Trypsinum

DEFINITION

Trypsin is a proteolytic enzyme obtained by the activation of trypsinogen extracted from the pancreas of healthy mammals. It has an activity not less than 0.5 microkatal per milligram, calculated with reference to the dried substance. In solution, it has maximum enzymic activity at pH 8; the activity is reversibly inhibited at pH 3, at which pH it is most stable.

PRODUCTION

The animals from which trypsin is derived must fulfil the requirements for the health of animals suitable for human consumption to the satisfaction of the competent authority.

It must have been shown to what extent the method of production allows inactivation or removal of any contamination by viruses or other infectious agents.

The method of manufacture is validated to demonstrate that the product, if tested, would comply with the following test:

Histamine (2.6.10). Not more than 1 µg of histamine base per 0.2 microkatal of trypsin activity. Use a 10 g/l solution of the substance to be examined in 0.0015 M *borate buffer solution pH 8.0 R* inactivated by heating on a water-bath for 30 min. Carry out dilutions with a 9 g/l solution of *sodium chloride R*.

CHARACTERS

A white or almost white, crystalline or amorphous powder, sparingly soluble in water. The amorphous form is hygroscopic.

IDENTIFICATION

- Dilute 1 ml of solution S (see Tests) to 100 ml with *water R*. In a depression in a white spot-plate, mix 0.1 ml of this solution with 0.2 ml of *tosylarginine methyl ester hydrochloride solution R*. A reddish-violet colour develops within 3 min.
- Dilute 0.5 ml of solution S to 5 ml with *water R*. Add 0.1 ml of a 20 g/l solution of *tosyl-lysyl-chloromethane hydrochloride R*. Adjust to pH 7.0, shake for 2 h and dilute to 50 ml with *water R*. In one of the depressions of a white spot-plate, mix 0.1 ml of this solution with 0.2 ml of *tosylarginine methyl ester hydrochloride solution R*. No reddish-violet colour develops within 3 min.

TESTS

Solution S. Dissolve 0.10 g in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension III (2.2.1).

pH (2.2.3). The pH of solution S is 3.0 to 6.0.

Absorbance (2.2.25). Dissolve 30.0 mg in 0.001 M *hydrochloric acid* and dilute to 100.0 ml with the same acid. The solution shows an absorption maximum at 280 nm and a minimum at 250 nm. The specific absorbance at the maximum is 13.5 to 16.5 and that at the minimum is not greater than 7.0.

Chymotrypsin. To 1.8 ml of *buffer solution pH 8.0 R* add 7.4 ml of *water R* and 0.5 ml of 0.2 M *acetyltyrosine ethyl ester R*. While shaking the solution, add 0.3 ml of solution S and start a stop-watch. After exactly 5 min, measure the pH (2.2.3) (test solution). Prepare a reference solution in the same manner, replacing solution S by 0.3 ml of a 0.5 g/l solution of *chymotrypsin BRP* and measure the pH (2.2.3) exactly 5 min after adding the chymotrypsin. The pH of the test solution is higher than that of the reference solution.

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 0.500 g by drying at 60 °C at a pressure not exceeding 670 Pa for 2 h.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10⁴ micro-organisms per gram, determined by plate count. It complies with the tests for *Escherichia coli* and *Salmonella* (2.6.13).

ASSAY

The activity of trypsin is determined by comparing the rate at which it hydrolyses *benzoylarginine ethyl ester hydrochloride R* with the rate at which *trypsin BRP* hydrolyses the same substrate in the same conditions.

Apparatus. Use a reaction vessel of about 30 ml capacity provided with:

01/2005:1272

- a device that will maintain a temperature of 25.0 ± 0.1 °C,
- a stirring device (for example, a magnetic stirrer),
- a lid with holes for the insertion of electrodes, the tip of a burette, a tube for the admission of nitrogen and the introduction of reagents.

An automatic or manual titration device may be used. For the latter, the burette is graduated in 0.005 ml and the pH meter is provided with a wide-range scale and glass-calomel electrodes.

Test solution. Dissolve sufficient of the substance to be examined in 0.001 M hydrochloric acid and dilute to 25.0 ml with the same acid in order to obtain a solution containing approximately 700 nanokatal per millilitre.

Reference solution. Dissolve 25.0 mg of *trypsin BRP* in 0.001 M hydrochloric acid and dilute to 25.0 ml with the same acid.

Store the solutions at 0 °C to 5 °C. Warm 1 ml of each solution to about 25 °C over 15 min and use 50 µl of each solution for each titration. Carry out the titration in an atmosphere of nitrogen. Transfer 10.0 ml of 0.0015 M borate buffer solution pH 8.0 R to the reaction vessel and, while stirring, add 1.0 ml of a freshly prepared 6.86 g/l solution of *benzoylarginine ethyl ester hydrochloride R*. When the temperature is steady at 25.0 ± 0.1 °C (after about 5 min) adjust the pH to exactly 8.0 with 0.1 M sodium hydroxide. Add 50 µl of the test solution and start a timer. Maintain the pH at 8.0 by the addition of 0.1 M sodium hydroxide the tip of the microburette being immersed in the solution; note the volume added every 30 s. Follow the reaction for 8 min. Calculate the volume of 0.1 M sodium hydroxide used per second. Carry out a titration in the same manner using the reference solution and calculate the volume of 0.1 M sodium hydroxide used per second.

Calculate the activity in microkatal per milligram using the expression:

$$\frac{m' \times V}{m \times V'} \times A$$

- m* = mass of the substance to be examined, in milligrams,
m' = mass of *trypsin BRP*, in milligrams,
V = volume of 0.1 M sodium hydroxide used per second by the test solution,
V' = volume of 0.1 M sodium hydroxide used per second by the reference solution,
A = activity of *trypsin BRP*, in microkatal per milligram.

STORAGE

Store in an airtight container, protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

The label states the activity in microkatal per milligram.

TRYPTOPHAN

Tryptophanum

C₁₁H₁₂N₂O₂M_r 204.2

DEFINITION

Tryptophan contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (S)-2-amino-3-(1H-indol-3-yl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline or amorphous powder, sparingly soluble in water, slightly soluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

- It complies with the test for specific optical rotation (see Tests).
- Examine the substance by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tryptophan CRS*. Examine the substances prepared as discs.
- Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 20 mg in 10 ml of *water R*. Add 5 ml of *dimethylaminobenzaldehyde solution R6* and 2 ml of *hydrochloric acid R1*. Heat on a water-bath. A purple-blue colour develops.

TESTS

Appearance of solution. Dissolve 0.1 g in 1 M hydrochloric acid and dilute to 10 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7). Dissolve 0.25 g in *water R*, heating on a water-bath if necessary, and dilute to 25.0 ml with the same solvent. The specific optical rotation is –30.0 to –33.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with a mixture of equal volumes of *glacial acetic acid R* and *water R*.

Reference solution (a). Dissolve 10 mg of *tryptophan CRS* in a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with a mixture of equal volumes of *glacial acetic acid R* and *water R*.

Reference solution (c). Dissolve 10 mg of *tryptophan CRS* and 10 mg of *tyrosine CRS* in a mixture of equal volumes of *glacial acetic acid R* and *water R* and dilute to 25 ml with the same mixture of solvents.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

1,1'-Ethylidenebistryptophan and other related substances. Examine by liquid chromatography (2.2.29).

Buffer solution pH 2.3. Dissolve 3.90 g of *sodium dihydrogen phosphate R* in 1000 ml of *water R*. Add about 700 ml of a 2.9 g/l solution of *phosphoric acid R* and adjust to pH 2.3 with the same acidic solution.

Prepare the solutions immediately before use.

Standard solution. Dissolve 10.0 mg of *N-acetyltryptophan R* in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents. Dilute 2.0 ml of the solution to 100.0 ml with the same mixture of solvents.

Test solution (a). Dissolve 0.10 g of the substance to be examined in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 10.0 ml the same mixture of solvents.

Test solution (b). Dissolve 0.10 g of the substance to be examined in the standard solution and dilute to 10.0 ml with the same solution.

Reference solution (a). Dissolve 1.0 mg of *1,1'-ethylidenebistryptophan CRS* in a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dilute 10.0 ml of reference solution (a) to 50.0 ml with the standard solution.

Reference solution (c). Dilute 10.0 ml of reference solution (a) to 50.0 ml with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R*.

Reference solution (d). Dissolve 0.10 g of the substance to be examined in reference solution (c) and dilute to 10.0 ml with the same solution.

Reference solution (e). Dilute 1.0 ml of reference solution (c) to 10.0 ml with a mixture of 10 volumes of *acetonitrile R* and 90 volumes of *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 0.7 ml/min the following solutions:

Mobile phase A. A mixture of 115 volumes of *acetonitrile R* and 885 volumes of buffer solution pH 2.3,

Mobile phase B. A mixture of 350 volumes of *acetonitrile R* and 650 volumes of buffer solution pH 2.3,

- a gradient programme using the following conditions:

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 10	100	0	isocratic
10 - 45	100 → 0	0 → 100	linear gradient
45 - 65	0	100	isocratic
65 - 66	0 → 100	100 → 0	linear gradient
66 - 80	100	0	re-equilibration

- as detector a spectrophotometer set at 220 nm, maintaining the temperature of the column at 40 °C.

Inject 20 µl of reference solution (b), 20 µl of reference solution (d) and 20 µl of reference solution (e).

When the chromatograms are recorded in the prescribed conditions, the retention times are about 8 min for tryptophan, about 29 min for *N-acetyltryptophan* and about 34 min for *1,1'-ethylidenebistryptophan*. Adjust the sensitivity of the system so that the height of the peak due to *N-acetyltryptophan* in the chromatogram obtained with reference solution (b) is at least 50 per cent of the full scale of the recorder.

The test is not valid unless:

- in the chromatogram obtained with reference solution (b), the resolution between the peaks corresponding to *N-acetyltryptophan* and *1,1'-ethylidenebistryptophan* is at least 8.0. If necessary, adjust the time programme for the elution gradient. An increase in the duration of elution with mobile phase A produces longer retention times and better resolution;
- the chromatogram obtained with reference solution (e) has a signal-to-noise ratio of at least 15.

Inject 20 µl of test solution (a) and 20 µl of test solution (b). Check that in the chromatogram obtained with test solution (a) there is no peak with the same retention time as *N-acetyltryptophan* (in such case correct the area of the *N-acetyltryptophan* peak). In the chromatogram obtained with test solution (b): the area of any peak corresponding to *1,1'-ethylidenebistryptophan* is not greater than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (e) (10 ppm); the sum of the areas of any peaks with retention times less than that of tryptophan is not greater than 0.6 times the area of the peak corresponding to *N-acetyltryptophan* in the chromatogram obtained with reference solution (b) (100 ppm); the sum of the areas of any peaks with a retention time greater than that of tryptophan, apart from *N-acetyltryptophan*, and up to 1.8 times the retention time of *N-acetyltryptophan*, is not greater than 1.9 times the area of the peak due to *N-acetyltryptophan* in the chromatogram obtained with reference solution (b) (300 ppm). Disregard any peak with an area less than 0.02 times that of the peak due to *N-acetyltryptophan* in the chromatogram obtained with reference solution (b).

Chlorides (2.4.4). Dissolve 0.25 g in 3 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution without any further addition of nitric acid (200 ppm), complies with the limit test for chlorides.

Sulphates (2.4.13). Dissolve 0.5 g in a mixture of 5 volumes of *dilute hydrochloric acid R* and 25 volumes of *distilled water R* and dilute to 15 ml with the same mixture of solvents. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 0.50 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone RI*, shaking for 3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (20 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, using 0.1 ml of *naphtholbenzein solution R* as indicator.

1 ml of 0.1 M *perchloric acid* is equivalent to 20.42 mg of $C_{11}H_{12}N_2O_2$.

STORAGE

Store protected from light.

IMPURITIES

- A. 3,3'-[ethylidenebis(1*H*-indole-1,3-diyl)]bis[(2*S*)-2-aminopropanoic] acid (1,1'-ethylidenebistryptophan),

- B. (*S*)-2-amino-3-[(3*RS*)-3-hydroxy-2-oxo-2,3-dihydro-1*H*-indol-3-yl]propanoic acid (dioxindolylalanine),

- C. R = H: (*S*)-2-amino-4-(2-aminophenyl)-4-oxobutanoic acid (kynurenine),

- E. R = CHO: (*S*)-2-amino-4-[2-(formylamino)phenyl]-4-oxobutanoic acid (*N*-formylkynurenine),

- D. (*S*)-2-amino-3-(5-hydroxy-1*H*-indol-3-yl)propanoic acid (5-hydroxytryptophan),

- F. (*S*)-2-amino-3-(phenylamino)propanoic acid (3-phenylaminoalanine),

- G. (*S*)-2-amino-3-(2-hydroxy-1*H*-indol-3-yl)propanoic acid (2-hydroxytryptophan),

- H. R = H: (3*RS*)-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid,

- I. R = CH₃: 1-methyl-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid,

- J. R = CHOH-CH₂-OH: (*S*)-2-amino-3-[2-[2,3-dihydroxy-1-(1*H*-indol-3-yl)propyl]-1*H*-indol-3-yl]propanoic acid,

- K. R = H: (*S*)-2-amino-3-[2-(1*H*-indol-3-ylmethyl)-1*H*-indol-3-yl]propanoic acid,

- L. 1-(1*H*-indol-3-ylmethyl)-1,2,3,4-tetrahydro-9*H*-β-carboline-3-carboxylic acid.

01/2005:0152

TUBERCULIN FOR HUMAN USE, OLD

Tuberculinum pristinum ad usum humanum

DEFINITION

Old tuberculin for human use consists of a filtrate, concentrated by heating, containing the soluble products of the culture and lysis of one or more strains of *Mycobacterium*

bovis and/or *Mycobacterium tuberculosis* that is capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Old tuberculin for human use in concentrated form is a transparent, viscous, yellow or brown liquid.

PRODUCTION

GENERAL PROVISIONS

The production of old tuberculin is based on a seed-lot system. The production method shall have been shown to yield consistently old tuberculin of adequate potency and safety in man. A batch of old tuberculin, calibrated in International Units by the method described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for the production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

Identification. The species of mycobacterium of the master and working seed lots is identified.

Bacterial and fungal contamination. Carry out the test for sterility (2.6.1), using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

PROPAGATION AND HARVEST

The bacteria are grown in a liquid medium which may be a glycerolated broth or a synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method, such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h. The culture liquid, from which the micro-organisms may or may not have been separated by filtration, is concentrated by evaporation, usually to one-tenth of its initial volume. The preparation is free from live mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria (2.6.2) before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/l) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin.

pH (2.2.3). The pH of the concentrated harvest is 6.5 to 8.

Glycerol. Where applicable, determine the glycerol content of the concentrated harvest. The amount is within the limits approved for the particular product.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/l (2.5.15).

Sensitisation. Carry out the test described under Tests.

Sterility (2.6.1). The concentrated harvest complies with the test for sterility, carried out using 10 ml for each medium.

Potency. Determine the potency as described under Assay.

FINAL BULK TUBERCULIN

The concentrated harvest is diluted aseptically.

Only a final bulk tuberculin that complies with the following requirement may be used in the preparation of the final lot.

Sterility (2.6.1). The final bulk tuberculin complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

The final bulk tuberculin is distributed aseptically into sterile containers which are then closed so as to prevent contamination.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

- live mycobacteria: concentrated harvest,
- sensitisation: concentrated harvest,
- toxicity: concentrated harvest or final bulk tuberculin,
- antimicrobial preservative: final bulk tuberculin.

IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example, as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

TESTS

Old tuberculin for human use in concentrated form (≥ 100 000 IU/ml) complies with each of the tests prescribed below; the diluted product complies with the tests for antimicrobial preservative and sterility.

Toxicity. Inject a quantity equivalent to 50 000 IU subcutaneously into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

Sensitisation. Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 ml. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of 3 guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/l (2.5.15).

Live mycobacteria (2.6.2). It complies with the test for mycobacteria.

Sterility (2.6.1). It complies with the test for sterility.

ASSAY

The potency of old tuberculin is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg to 0.4 mg/ml) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least three injections on each side and not more than a total of 12 injection points per animal. Use at least three different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store protected from light.

LABELLING

The label states:

- the number of International Units per millilitre,
- the species of mycobacterium used to prepare the product,
- the name and quantity of any antimicrobial preservative or other substance added to the preparation,
- the expiry date,
- where applicable, that old tuberculin is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

01/2005:0535

TUBERCULIN PURIFIED PROTEIN DERIVATIVE, AVIAN

Tuberculini aviarii derivatum proteinosum purificatum

DEFINITION

Tuberculin purified protein derivative, avian (Tuberculin PPD, avian) is a preparation obtained from the heat-treated products of growth and lysis of *Mycobacterium avium* capable of revealing a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

PRODUCTION

It is obtained from the water-soluble fractions prepared by heating in free-flowing steam and subsequently filtering cultures of *M. avium* grown in a liquid synthetic medium. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. An antimicrobial preservative that does not give rise to false positive reactions, such as phenol, may be added. The final sterile preparation, free from mycobacteria, is distributed aseptically into sterile tamper-proof glass containers which are then closed so as to prevent contamination. The preparation may be freeze-dried.

The identification, the tests and the determination of potency apply to the liquid form and to the freeze-dried form after reconstitution as stated on the label.

IDENTIFICATION

Inject a range of graded doses intradermally at different sites into suitably sensitised albino guinea-pigs, each weighing not less than 250 g. After 24 h to 28 h, reactions appear in the form of oedematous swellings with erythema with or without necrosis at the points of injection. The size and severity of the reactions vary according to the dose. Unsensitised guinea-pigs show no reactions to similar injections.

TESTS

pH (2.2.3). The pH is 6.5 to 7.5.

Phenol (2.5.15). If the preparation to be examined contains phenol, its concentration is not more than 5 g/l.

Sensitising effect. Use a group of three guinea-pigs that have not been treated with any material which will interfere with the test. On three occasions at intervals of 5 days inject intradermally into each guinea-pig a dose of the preparation to be examined equivalent to 500 IU in 0.1 ml. Fifteen to twenty-one days after the third injection, inject the same dose (500 IU) intradermally into these animals and into a control group of three guinea-pigs of the same mass and which have not previously received injections of tuberculin. 24 h to 28 h after the last injections, the reactions of the two groups are not significantly different.

Toxicity. Use two guinea-pigs, each weighing not less than 250 g and which have not previously been treated with any material which will interfere with the test. Inject subcutaneously into each guinea-pig 0.5 ml of the preparation to be examined. Observe the animals for 7 days. No abnormal effects occur during the observation period.

Sterility. It complies with the test for sterility prescribed in the monograph on *Vaccines for veterinary use (0062)*.

POTENCY

The potency of tuberculin purified protein derivative, avian is determined by comparing the reactions produced in sensitised guinea-pigs by the intradermal injection of a series of dilutions of the preparation to be examined with those produced by known concentrations of a reference preparation of tuberculin purified protein derivative, avian calibrated in International Units.

The International Unit is the activity contained in a stated amount of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Sensitise not fewer than nine albino guinea-pigs, each weighing 400 g to 600 g, by the deep intramuscular injection of a suitable dose of inactivated or live *M. avium*. Not less than four weeks after the sensitisation of the guinea-pigs, shave their flanks to provide space for not more than four injection sites on each side. Prepare dilutions of the

preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 0.005 g/l of *polysorbate 80 R*. Use not fewer than three doses of the reference preparation and not fewer than three doses of the preparation to be examined. Choose the doses such that the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. Allocate the dilutions randomly to the sites using a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions after 24 h to 28 h and calculate the result of the test using the usual statistical methods and assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the tuberculin.

The test is not valid unless the confidence limits ($P = 0.95$) are not less than 50 per cent and not more than 200 per cent of the estimated potency. The estimated potency is not less than 75 per cent and not more than 133 per cent of the stated potency. The stated potency is not less than 20 000 IU/ml.

STORAGE

Store protected from light, at a temperature of 5 ± 3 °C.

LABELLING

The label states:

- the potency in International Units per millilitre.
- the name and quantity of any added substance,
- for freeze-dried preparations:
- the name and volume of the reconstituting liquid to be added,
- that the product should be used immediately after reconstitution.

01/2005:0536

TUBERCULIN PURIFIED PROTEIN DERIVATIVE, BOVINE

Tuberculini bovini derivatum proteinosum purificatum

DEFINITION

Tuberculin purified protein derivative, bovine (Tuberculin PPD, bovine) is a preparation obtained from the heat-treated products of growth and lysis of *Mycobacterium bovis* capable of revealing a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

PRODUCTION

It is obtained from the water-soluble fractions prepared by heating in free-flowing steam and subsequently filtering cultures of *M. bovis* grown in a liquid synthetic medium. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. An antimicrobial preservative that does not give rise to false positive reactions, such as phenol, may be added. The final sterile preparation, free from mycobacteria, is distributed aseptically into sterile, tamper-proof glass containers which are then closed so as to prevent contamination. The preparation may be freeze-dried.

The identification, the tests and the determination of potency apply to the liquid form and to the freeze-dried form after reconstitution as stated on the label.

IDENTIFICATION

Inject a range of graded doses intradermally at different sites into suitably sensitised albino guinea-pigs, each weighing not less than 250 g. After 24 h to 28 h, reactions appear in the form of oedematous swellings with erythema with or without necrosis at the points of injection. The size and severity of the reactions vary according to the dose. Unsensitised guinea-pigs show no reactions to similar injections.

TESTS

pH (2.2.3). The pH is 6.5 to 7.5.

Phenol (2.5.15). If the preparation to be examined contains phenol, its concentration is not more than 5 g/l.

Sensitising effect. Use a group of 3 guinea-pigs that have not been treated with any material which will interfere with the test. On 3 occasions at intervals of 5 days inject intradermally into each guinea-pig a dose of the preparation to be examined equivalent to 500 IU in 0.1 ml. 15 to 21 days after the third injection inject the same dose (500 IU) intradermally into these animals and into a control group of 3 guinea-pigs of the same mass and which have not previously received injections of tuberculin. 24 h to 28 h after the last injections, the reactions of the 2 groups are not significantly different.

Toxicity. Use 2 guinea-pigs, each weighing not less than 250 g and which have not previously been treated with any material which will interfere with the test. Inject subcutaneously into each guinea-pig 0.5 ml of the preparation to be examined. Observe the animals for 7 days. No abnormal effects occur during the observation period.

Sterility. It complies with the test for sterility prescribed in the monograph on *Vaccines for veterinary use* (0062).

POTENCY

The potency of tuberculin purified protein derivative, bovine is determined by comparing the reactions produced in sensitised guinea-pigs by the intradermal injection of a series of dilutions of the preparation to be examined with those produced by known concentrations of a reference preparation calibrated in International Units.

Sensitise not fewer than 9 albino guinea-pigs, each weighing 400 g to 600 g, by the deep intramuscular injection of 0.0001 mg of wet mass of living *M. bovis* of strain AN5 suspended in 0.5 ml of a 9 g/l solution of *sodium chloride R*. Not less than 4 weeks after the sensitisation of the guinea-pigs, shave their flanks to provide space for not more than 4 injection sites on each side. Prepare dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5-7.5) containing 0.005 g/l of *polysorbate 80 R*. Use not fewer than 3 doses of the reference preparation and not fewer than 3 doses of the preparation to be examined. Choose the doses such that the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. Allocate the dilutions randomly to the sites using a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions after 24 h to 28 h and calculate the result of the test using the usual statistical methods and assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the tuberculin.

The test is not valid unless the confidence limits ($P = 0.95$) are not less than 50 per cent and not more than 200 per cent of the estimated potency. The estimated potency is not less than 66 per cent and not more than 150 per cent of the stated potency. The stated potency is not less than 20 000 IU/ml.

STORAGE

Protected from light, at a temperature of 5 ± 3 °C.

LABELLING

The label states:

- the potency in International Units per millilitre,
- the name and quantity of any added substance,
- for freeze-dried preparations:
 - the name and volume of the reconstituting liquid to be added,
 - that the product should be used immediately after reconstitution.

01/2005:0151

TUBERCULIN PURIFIED PROTEIN DERIVATIVE FOR HUMAN USE

Tuberculini derivatum proteinosum purificatum ad usum humanum

DEFINITION

Tuberculin purified protein derivative (tuberculin PPD) for human use is a preparation obtained by precipitation from the heated products of the culture and lysis of *Mycobacterium bovis* and/or *Mycobacterium tuberculosis* and capable of demonstrating a delayed hypersensitivity in an animal sensitised to micro-organisms of the same species.

Tuberculin PPD is a colourless or pale-yellow liquid; the diluted preparation may be a freeze-dried powder which upon dissolution gives a colourless or pale-yellow liquid.

PRODUCTION

GENERAL PROVISIONS

The production of tuberculin PPD is based on a seed-lot system. The production method shall have been shown to yield consistently tuberculin PPD of adequate potency and safety in man. A batch of tuberculin PPD, calibrated in International Units by method A described under Assay and for which adequate clinical information is available as to its activity in man, is set aside to serve as a reference preparation.

The International Unit is the activity of a stated quantity of the International Standard. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

SEED LOTS

The strains of mycobacteria used shall be identified by historical records that include information on their origin and subsequent manipulation.

The working seed lots used to inoculate the media for production of a concentrated harvest shall not have undergone more than 4 subcultures from the master seed lot.

Only seed lots that comply with the following requirements may be used for propagation.

Identification. The species of mycobacterium of the master and working seed lots is identified.

Bacterial and fungal contamination. Carry out the test for sterility (2.6.1), using 10 ml for each medium. The working seed lot complies with the test for sterility except for the presence of mycobacteria.

PROPAGATION AND HARVEST

The bacteria are grown in a liquid synthetic medium. Growth must be typical for the strain. The culture is inactivated by a suitable method such as treatment in an autoclave (121 °C for not less than 30 min) or in flowing steam at a temperature not less than 100 °C for at least 1 h and filtered. The active fraction of the filtrate, consisting mainly of protein, is isolated by precipitation, washed and re-dissolved. The preparation is free from mycobacteria. The concentrated harvest is shown to comply with the test for mycobacteria (2.6.2) before addition of any antimicrobial preservative or other substance that might interfere with the test. Phenol (5 g/l) or another suitable antimicrobial preservative that does not give rise to false positive reactions may be added; a suitable stabiliser intended to prevent adsorption on glass or plastic surfaces may be added. The concentrated harvest may be freeze-dried. Phenol is not added to preparations that are to be freeze-dried.

Only a concentrated harvest that complies with the following requirements may be used in the preparation of the final bulk tuberculin PPD.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than 85 per cent and not more than 115 per cent of the intended amount. If phenol has been used in the preparation, the concentration is not more than 5 g/l (2.5.15).

Sensitisation. Carry out the test described under Tests.

Sterility (2.6.1). The concentrated harvest, reconstituted if necessary, complies with the test for sterility, carried out using 10 ml for each medium.

Potency. Determine the potency as described under Assay.

FINAL BULK TUBERCULIN PPD

The concentrated harvest is diluted aseptically, after reconstitution if necessary.

Only a final bulk tuberculin PPD that complies with the following requirement may be used in the preparation of the final lot.

Sterility (2.6.1). The final bulk tuberculin PPD complies with the test for sterility, carried out using 10 ml for each medium.

FINAL LOT

The final bulk tuberculin PPD is distributed aseptically into sterile containers which are then closed so as to prevent contamination. It may be freeze-dried.

Only a final lot that is satisfactory with respect to each of the requirements given below under Identification, Tests and Assay may be released for use.

The following tests may be omitted on the final lot if they have been carried out at the stages indicated:

- live mycobacteria: concentrated harvest
- sensitisation: concentrated harvest
- toxicity: concentrated harvest or final bulk tuberculin PPD
- antimicrobial preservative: final bulk tuberculin PPD.

IDENTIFICATION

Inject increasing doses of the preparation to be examined intradermally into healthy, white or pale-coloured guinea-pigs, specifically sensitised (for example as described under Assay). A reaction varying from erythema to necrosis is produced at the site of the injection. Similar injections administered to non-sensitised guinea-pigs do not stimulate a reaction. The assay may also serve as identification.

TESTS

Tuberculin purified protein derivative for human use in concentrated form ($\geq 100\,000$ IU/ml) complies with each of the tests prescribed below; the diluted product complies with the tests for pH, antimicrobial preservative and sterility.

pH (2.2.3). The pH of the preparation, reconstituted if necessary as stated on the label, is 6.5 to 7.5.

Toxicity. Inject subcutaneously 50 000 IU of the preparation to be examined into each of two healthy guinea-pigs weighing 250 g to 350 g and which have not been subjected to any treatment likely to interfere with the test. Observe the animals for 7 days. No adverse effect is produced.

Sensitisation. Use 3 guinea-pigs that have not been subjected to any treatment likely to interfere with the test. On 3 occasions at intervals of 5 days, inject intradermally into each guinea-pig about 500 IU of the preparation to be examined in a volume of 0.1 ml. 2 to 3 weeks after the third injection, administer the same dose intradermally to the same animals and to a control group of three guinea-pigs of the same mass that have not previously received injections of tuberculin. After 24 h to 72 h, the reactions in the 2 groups of animals are not substantially different.

Antimicrobial preservative. Where applicable, determine the amount of antimicrobial preservative by a suitable chemical or physico-chemical method. The content is not less than the minimum amount shown to be effective and not more than 115 per cent of the amount stated on the label. If phenol has been used in the preparation, the concentration is not more than 5 g/l (2.5.15).

Live mycobacteria (2.6.2). It complies with the test for mycobacteria.

Sterility (2.6.1). It complies with the test for sterility.

ASSAY

Use method A or, where the preparation contains 1 IU to 2 IU, use method B.

METHOD A

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of increasing doses of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension containing a suitable amount (0.1 mg/ml to 0.4 mg/ml) of heat-inactivated, dried mycobacteria in mineral oil with or without emulsifier; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than six pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the preparation to be examined and of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/l of *polysorbate 80 R*. If the preparation to be examined is freeze-dried and does not contain a stabiliser, reconstitute it using the liquid described above. Use at least 3 different doses of the reference preparation and at least 3 different doses of the preparation to be examined. For both preparations, use doses such that the highest dose is about 10 times the lowest dose. Choose the doses such that

when they are injected the lesions produced have a diameter of not less than 8 mm and not more than 25 mm. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject each dose intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the diameters of the lesions are directly proportional to the logarithm of the concentration of the preparation.

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

METHOD B

The potency of tuberculin PPD is determined by comparing the reactions produced by the intradermal injection of the preparation to be examined into sensitised guinea-pigs with the reactions produced by known concentrations of the reference preparation.

Prepare a suspension in mineral oil with or without emulsifier and containing a suitable amount (0.1 mg/ml to 0.4 mg/ml) of heat-inactivated, dried mycobacteria; use mycobacteria of a strain of the same species as that used in the preparation to be examined. Sensitise not fewer than 6 pale-coloured guinea-pigs weighing not less than 300 g by injecting intramuscularly or intradermally a total of about 0.5 ml of the suspension, divided between several sites if necessary. Carry out the test after the period of time required for optimal sensitisation which is usually 4 to 8 weeks after sensitisation. Depilate the flanks of the animals so that it is possible to make at least 3 injections on each side but not more than a total of 12 injection points per animal. Prepare dilutions of the reference preparation using isotonic phosphate-buffered saline (pH 6.5 to 7.5) containing 50 mg/l of *polysorbate 80 R*. Use at least 3 different doses of the reference preparation such that the highest dose is about 10 times the lowest dose and the median dose is the same as that of the preparation to be examined. In any given test, the order of the dilutions injected at each point is chosen at random in a Latin square design. Inject the preparation to be examined and each dilution of the reference preparation intradermally in a constant volume of 0.1 ml or 0.2 ml. Measure the diameters of the lesions 24 h to 48 h later and calculate the results of the test by the usual statistical methods, assuming that the areas of the lesions are directly proportional to the logarithm of the concentration of the preparation to be examined. (This dose relationship applies to this assay and not necessarily to other test systems.)

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits ($P = 0.95$) are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

Store protected from light.

LABELLING

The label states:

- the number of International Units per container,
- the species of mycobacteria used to prepare the product,
- the name and quantity of any antimicrobial preservative or other substance added to the preparation,
- the expiry date,
- for freeze-dried products, a statement that the product is to be reconstituted using the liquid provided by the manufacturer,

- where applicable, that tuberculin PPD is not to be injected in its concentrated form but diluted so as to administer not more than 100 IU per dose.

If the package does not contain a leaflet warning that the inhalation of concentrated tuberculin PPD may produce toxic effects, this warning must be shown on the label on the container together with a statement that the powder must be handled with care.

01/2005:0305

TUBOCURARINE CHLORIDE

Tubocurarini chloridum

 $\text{C}_{37}\text{H}_{42}\text{Cl}_2\text{N}_2\text{O}_6 \cdot 5\text{H}_2\text{O}$ M_r 772

DEFINITION

Tubocurarine chloride contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of (3a*R*,16a*S*)-8,23-dihydroxy-24,29-dimethoxy-3,3,16-trimethyl-2,3,3a,4,15,16,16a,17-octahydro-1*H*-11,13:18,21-dietheno-5,9-metheno-14*H*-pyrido[3',2':14,15][1,11]dioxacycloicosino[2,3,4-*i*]isoquinolinium chloride hydrochloride, calculated with reference to the anhydrous substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, soluble in water and in alcohol, practically insoluble in acetone. It dissolves in solutions of alkali hydroxides.

It melts at about 270 °C, with decomposition.

IDENTIFICATION

First identification: B, E.

Second identification: A, C, D, E, F.

- Dissolve 50.0 mg in *water R* and dilute to 1000.0 ml with the same solvent. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 280 nm and a minimum at 255 nm. The specific absorbance at the maximum is 113 to 123, calculated with reference to the anhydrous substance.
- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tubocurarine chloride CRS*.
- Dissolve about 25 mg in 1 ml of *water R*. Add 0.2 ml of *ferric chloride solution R2* and heat in a water-bath for 1 min. The solution is green. Carry out a blank test; after heating in a water-bath, the colour is brown.
- To 1 ml of solution S (see Tests) add 1 ml of *nitric acid solution of mercury R*. A red colour develops slowly.

E. It gives reaction (a) of chlorides (2.3.1).

F. It gives the reaction of alkaloids (2.3.1).

TESTS

Solution S. Dissolve 0.25 g in *carbon dioxide-free water R* and dilute to 25.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 4.0 to 6.0.

Specific optical rotation (2.2.7): + 210 to + 222, determined on solution S 3 h after preparation and calculated with reference to the anhydrous substance.

Chloroform-soluble substances. Dissolve 0.25 g in 150 ml of *water R*. Add 5 ml of a saturated solution of *sodium bicarbonate R* and shake with three quantities, each of 20 ml, of *chloroform R*. Wash the combined chloroform layers with 10 ml of *water R*, filter the chloroform solution into a tared beaker and wash the filter with two quantities, each of 5 ml, of *chloroform R*. Add the washings to the filtrate. Evaporate to dryness on a water-bath and dry at 100–105 °C for 1 h. The residue weighs not more than 5 mg. The residue does not dissolve in 10 ml of *water R*, but dissolves on the addition of 1 ml of *dilute hydrochloric acid R*.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution. Dissolve 0.25 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1.5 ml of the test solution to 100 ml with *water R*.

Reference solution (b). Dilute 5 ml of reference solution (a) to 10 ml with *water R*.

Apply to the plate 5 µl of each solution. Develop in a non-saturated tank over a path of 15 cm using the lower layer of a mixture of equal volumes of *chloroform R*, *methanol R* and a 125 g/l solution of *trichloroacetic acid R*. Dry the plate in a current of cold air. Spray with a mixture of 1 volume of *potassium ferricyanide solution R*, 1 volume of *water R* and 2 volumes of *ferric chloride solution R1*, prepared immediately before use. Any spot in the chromatogram obtained with the test solution, apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (1.5 per cent) and at most one such spot is more intense than the spot in the chromatogram obtained with reference solution (b) (0.75 per cent).

Water (2.5.12): 9.0 per cent to 12.0 per cent, determined on 0.30 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.25 per cent, determined on 0.2 g.

ASSAY

Dissolve 25.0 mg in *water R* and dilute to 500.0 ml with the same solvent. In the same manner, prepare a reference solution using 25.0 mg of *tubocurarine chloride CRS*. Measure the absorbance (2.2.25) at the maximum at 280 nm.

Calculate the content of $\text{C}_{37}\text{H}_{42}\text{Cl}_2\text{N}_2\text{O}_6$ from the absorbances measured, the concentrations of the solutions and the declared content of anhydrous tubocurarine chloride in *tubocurarine chloride CRS*.

STORAGE

Store in an airtight container.

01/2005:1441

TURMERIC, JAVANESE**Curcumae xanthorrhizae rhizoma****DEFINITION**

Javanese turmeric consists of the dried rhizome, cut in slices, of *Curcuma xanthorrhiza* Roxb. (*C. xanthorrhiza* D. Dietrich). It contains not less than 50 ml/kg of essential oil and not less than 1.0 per cent of dicinnamoyl methane derivatives expressed as curcumin ($C_{21}H_{20}O_6$; M_r 368.4), both calculated with reference to the anhydrous drug.

CHARACTERS

Javanese turmeric has an aromatic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The drug consists of orange-yellow to yellowish-brown or greyish-brown slices, mostly peeled 1.5 mm to 6 mm thick and 15 mm to 50 mm, more rarely up to 70 mm, in diameter. Fragments of the brownish-grey cork are sporadically present. The transverse surface is yellow with dark spots in the paler centre. The fracture is short and finely grained.
- B. Reduce to a powder (355). The powder is reddish-brown. Examine under a microscope, using *chloral hydrate solution R*. The powder shows fragments of colourless parenchyma with orange-yellow to yellowish-brown secretory cells; fragments of reticulate and other vessels; rare fragments of cork and epidermis and fragments of thick-walled unicellular acute trichomes. Examine under a microscope using a 50 per cent *V/V* solution of *glycerol R*. The powder shows numerous stratified, ovoid to irregular starch granules, about 30 µm to 50 µm long and about 10 µm to 30 µm wide, with an eccentric hilum and marked, concentric striations.
- C. Examine by thin-layer chromatography as described in the test for *Curcuma domestica* until the words "Allow the plate to dry in the air". Spray the plate with a freshly prepared 0.4 g/l solution of *dichloroquinonechlorimide R* in *2-propanol R*. Expose the plate to ammonia vapour until the thymol zone becomes bluish-violet. The chromatogram obtained with the reference solution shows almost in the middle a bluish-violet zone (thymol) and in the lower part a yellow zone (fluorescein). The chromatogram obtained with the test solution shows a blue zone (xanthorrhizol) slightly above the zone due to thymol in the chromatogram obtained with the reference solution and two yellowish-brown to brown zones (curcumin and demethoxycurcumin) between the zones due to thymol and fluorescein in the chromatogram obtained with the reference solution.

TESTS

Foreign matter (2.8.2). It complies with the test for foreign matter.

Curcuma domestica. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Shake 0.5 g of the freshly powdered drug (500) with 5 ml of *methanol R* for 30 min and filter.

Reference solution. Dissolve 5 mg of *fluorescein R* and 10 mg of *thymol R* in 10 ml of *methanol R*.

Apply separately to the plate as bands 10 µl of each solution. Develop over a path of 10 cm using a mixture of 20 volumes of *glacial acetic acid R* and 80 volumes of *toluene R*. Allow

the plate to dry in air. Spray the plate with a mixture of 1 volume of *sulphuric acid R* and 9 volumes of *acetic anhydride R*. Examine the plate in ultraviolet light at 365 nm. In the chromatogram obtained with the test solution, no yellowish-red fluorescent zone (bisdemethoxycurcumin) appears slightly above the greenish-blue fluorescent zone of fluorescein in the chromatogram obtained with the reference solution.

Water (2.2.13). Not more than 120 ml/kg, determined by distillation on 20.0 g of powdered drug (500).

Total ash (2.4.16). Not more than 8.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in vegetable drugs (2.8.12). Use a 500 ml round-bottomed flask, 200 ml of *water R* as the distillation liquid and 0.5 ml of *xylene R* in the graduated tube. Reduce the drug to a powder (500) and immediately use 5.0 g for the determination. Distil at a rate of 3 ml/min to 4 ml/min for 3 h.

Dicinnamoyl methane derivatives. To 0.100 g of the powdered drug (180) add 60 ml of *glacial acetic acid R* and heat in a water-bath at 90 °C for 60 min. Add 2.0 g of *boric acid R* and 2.0 g of *oxalic acid R* and heat in a water-bath at 90 °C for 10 min. Allow to cool, dilute with *glacial acetic acid R* to 100.0 ml and shake. Dilute 5.0 ml of the clear supernatant with *glacial acetic acid R* to 50.0 ml. Measure the absorbance (2.2.25) at 530 nm, using *glacial acetic acid R* as the compensation liquid.

Calculate the percentage content of dicinnamoyl methane derivatives, expressed as curcumin, from the expression:

$$\frac{A \times 0.426}{m}$$

i.e. taking the specific absorbance to be 2350.

A = absorbance at 530 nm,

m = mass of the drug to be examined, in grams.

STORAGE

Store protected from light.

01/2005:1627

TURPENTINE OIL, PINUS PINASTER TYPE**Terebinthini aetheroleum ab pinum pinastrum****DEFINITION**

Essential oil obtained by steam distillation, followed by rectification at a temperature below 180 °C, from the oleoresin obtained by tapping *Pinus pinaster* Aiton. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, colourless or pale yellow liquid.

It has a characteristic odour.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Mix 1 ml of the substance to be examined with *toluene R* and dilute to 10 ml with the same solvent.

Reference solution. Mix 10 µl of *β-pinene R* and 10 µl of *linalol R* with *toluene R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *ethyl acetate R, toluene R* (5:95 V/V).

Application: 10 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection: spray with *anisaldehyde solution R* and heat at 100-105 °C for 5-10 min. Examine in daylight.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
β-Pinene: a pink zone	A pink zone (β-pinene)
	A pink zone
Linalol: a pinkish-grey zone	3 Faint violet zones
	A faint yellow zone
Reference solution	Test solution

B. Examine the chromatograms obtained in the test for chromatographic profile.

Results: the peaks in the chromatogram obtained with the test solution are similar in retention time to those in the chromatogram obtained with the reference solution.

TESTS

Relative density (2.2.5): 0.856 to 0.872.

Refractive index (2.2.6): 1.465 to 1.475.

Optical rotation (2.2.7): −40° to −28°.

Acid value (2.5.1): maximum 1.0.

Peroxide value (2.5.5, *Method B*): maximum 20.

Fatty oils and resinified essential oils (2.8.7). It complies with the test for fatty oils and resinified essential oils.

Chromatographic profile. Gas chromatography (2.2.28): use the normalisation procedure.

Test solution. The substance to be examined.

Reference solution (a). Dissolve 30 µl of *α-pinene R*, 10 mg of *camphene R*, 20 µl of *β-pinene R*, 10 µl of *car-3-ene R*, 10 µl of *β-myrcene R*, 20 µl of *limonene R*, 10 µl of *longifolene R*, 10 µl of *β-caryophyllene R* and 10 mg of *caryophyllene oxide R* in 1 ml of *hexane R*.

Reference solution (b). Dissolve 5 µl of *β-caryophyllene R* in *hexane R* and dilute to 1 ml with the same solvent. Dilute 0.1 ml to 1 ml with *hexane R*.

Column:

– *material:* fused silica,

– *size:* *l* = 60 m, Ø = 0.25 mm,

– *stationary phase:* *macrogol 20 000 R* (film thickness 0.25 µm).

Carrier gas: *helium for chromatography R*.

Flow rate: 1.0 ml/min.

Split ratio: 1:63.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 10	60
	10 - 80	60 → 200
	80 - 120	200
Injection port		200
Detector		250

Detection: flame ionisation.

Injection: 0.5 µl.

Elution order: order indicated in the composition of the reference solution (a); record the retention times of these substances.

System suitability:

– *resolution:* minimum 1.5 between the peaks due to *car-3-ene* and *β-myrcene* in the chromatogram obtained with reference solution (a).

Using the retention times determined from the chromatogram obtained with reference solution (a), locate the components of reference solution (a) in the chromatogram obtained with the test solution.

Determine the percentage content of these components. The limits are within the following ranges:

– *α-pinene:* 70.0 per cent to 85.0 per cent,

– *camphene:* 0.5 per cent to 1.5 per cent,

– *β-pinene:* 11.0 per cent to 20.0 per cent,

– *car-3-ene:* maximum 1.0 per cent,

– *β-myrcene:* 0.4 per cent to 1.5 per cent,

– *limonene:* 1.0 per cent to 7.0 per cent,

– *longifolene:* 0.2 per cent to 2.5 per cent,

– *β-caryophyllene:* 0.1 per cent to 3.0 per cent,

– *caryophyllene oxide:* maximum 1.0 per cent.

– *disregard limit:* area of the peak in the chromatogram obtained with reference solution (b) (0.05 per cent).

Residue on evaporation: maximum 2.5 per cent.

STORAGE

In a well-filled, airtight container, protected from light and at a temperature not exceeding 25 °C.

LABELLING

The label states the name and concentration of any added antioxidant.

01/2005:1273

TYLOSIN FOR VETERINARY USE

Tylosinum ad usum veterinarium

Name	Mol. Formula	R1	R2	R3
tylosin A	C ₄₆ H ₇₇ NO ₁₇	osyl	OCH ₃	CHO
tylosin B	C ₃₉ H ₆₅ NO ₁₄	H	OCH ₃	CHO
tylosin C	C ₄₅ H ₇₅ NO ₁₇	osyl	OH	CHO
tylosin D	C ₄₆ H ₇₉ NO ₁₇	osyl	OCH ₃	CH ₂ OH

DEFINITION

Tylosin for veterinary use is a mixture of macrolide antibiotics produced by a strain of *Streptomyces fradiae* or by any other means. The main component of the mixture is (4*R*,5*S*,6*S*,7*R*,9*R*,11*E*,13*E*,15*R*,16*R*)-15-[[[(6-deoxy-2,3-di-*O*-methyl-β-D-allopyranosyl)oxy]methyl]-6-[[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-*L*-ribo-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-16-ethyl-4-hydroxy-5,9,13-trimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-diene-2,10-dione (tylosin A, *M_r* 916). Tylosin B (desmycosin, *M_r* 772), tylosin C (macrocin, *M_r* 902) and tylosin D (relomycin, *M_r* 918) may also be present. They contribute to the potency of the substance to be examined, which is not less than 900 IU/mg, calculated with reference to the dried substance.

CHARACTERS

An almost white or slightly yellow powder, slightly soluble in water, freely soluble in ethanol and in methylene chloride. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *tylosin CRS*.
- Examine the chromatograms obtained in the test for composition. The retention time and size of the principal peak in the chromatogram obtained with the test solution are the same as those of the principal peak in the chromatogram obtained with reference solution (a).
- Dissolve about 30 mg in a mixture of 0.15 ml of *water R*, 2.5 ml of *acetic anhydride R* and 7.5 ml of *pyridine R*. Allow to stand for about 10 min. No green colour develops.

TESTS

pH (2.2.3). Suspend 0.25 g in 10 ml of *carbon dioxide-free water R*. The pH of the suspension is 8.5 to 10.5.

Composition. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

The content of tylosin A is not less than 80.0 per cent and the sum of the contents of tylosin A, tylosin B, tylosin C and tylosin D is not less than 95.0 per cent.

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20.0 mg of *tylosin CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 2 mg of *tylosin CRS* and 2 mg of *tylosin D CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.20 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of a 200 g/l solution of *sodium perchlorate R* previously adjusted to pH 2.5 using 1 *M* *hydrochloric acid*,
- as detector a spectrophotometer set at 290 nm, maintaining the temperature of the column at 35 °C.

Inject 20 µl of reference solution (b). When the chromatograms are recorded in the prescribed conditions, the retention time of tylosin A is about 12 min. The test is not valid unless, in the chromatogram obtained, the resolution between the peaks corresponding to tylosin A and tylosin D is at least 2.0. Inject 20 µl of the test solution and 20 µl of reference solution (a). Calculate the percentage content of the constituents from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure.

Tyramine. In a 25.0 ml volumetric flask, dissolve 50.0 mg of the substance to be examined in 5.0 ml of a 3.4 g/l solution of *phosphoric acid R*. Add 1.0 ml of *pyridine R* and 2.0 ml of a saturated solution of *ninhydrin R* (about 40 g/l). Close the flask with a piece of aluminium foil and heat in a water-bath at 85 °C for 30 min. Cool the solution rapidly and dilute to 25.0 ml with *water R*. Mix and measure immediately the absorbance (2.2.25) of the solution at 570 nm using a blank solution as the compensation liquid. The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 35 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R* (0.35 per cent). If intended for use in the manufacture of parenteral dosage forms, the absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 15 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R* (0.15 per cent).

Loss on drying (2.2.32). Not more than 5.0 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 3.0 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2). Use *tylosin CRS* as the reference substance.

STORAGE

Store protected from light.

IMPURITIES

A. desmycosyltylosin,

B. tylosin A aldol.

01/2005:1661

TYLOSIN PHOSPHATE BULK SOLUTION FOR VETERINARY USE

Tylosini phosphatis solutio ad usum
veterinarium

Tylosin	R1	R2	R3	Mol. Formula	<i>M_r</i>
A	osyl	OCH ₃	CHO	C ₄₆ H ₇₇ NO ₁₇	916
B	H	OCH ₃	CHO	C ₃₉ H ₆₅ NO ₁₄	772
C	osyl	OH	CHO	C ₄₅ H ₇₅ NO ₁₇	902
D	osyl	OCH ₃	CH ₂ OH	C ₄₆ H ₇₉ NO ₁₇	918

DEFINITION

Solution of the dihydrogen phosphate of a mixture of macrolide antibiotics produced by a strain of *Streptomyces fradiae* or by any other means.

The main component is the phosphate of (4*R*,5*S*,6*S*,7*R*,9*R*,11*E*,13*E*,15*R*,16*R*)-15-[[[(6-deoxy-2,3-di-*O*-methyl-β-*D*-allopyranosyl)oxy]methyl]-6-[[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-*L*-ribo-hexopyranosyl)-3-(dimethylamino)-β-*D*-glucopyranosyl]oxy]-16-ethyl-4-hydroxy-5,9,13-trimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-diene-2,10-dione (tylosin A phosphate). The phosphates of tylosin B (desmycosin phosphate), tylosin C (macrocin phosphate) and tylosin D (relomycin phosphate) may also be present. The solution also contains sodium dihydrogen phosphate.

Potency: minimum 800 IU/mg of dry residue. Tylosins A, B, C and D contribute to the potency.

CHARACTERS

Appearance: yellow or brownish-yellow, viscous liquid.

Solubility: miscible with water.

IDENTIFICATION

A. Dilute an amount of the preparation to be examined equivalent to 400 000 IU of tylosin phosphate to 100.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with *water R*. Examined between 230 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 290 nm. The absorbance at the maximum is not less than 0.70.

B. Examine the chromatograms obtained in the test for composition.

Results: the principal peak in the chromatogram obtained with the test solution is similar in retention time and size to the principal peak in the chromatogram obtained with reference solution (a).

C. Dilute an amount of the preparation to be examined equivalent to 400 000 IU of tylosin phosphate in 10 ml of *water R*. The solution gives reaction (a) of phosphates (2.3.1).

TESTS

pH (2.2.3): 5.5 to 6.5.

Dilute 1.0 g in 10 ml of *carbon dioxide-free water R*.

Composition. Liquid chromatography (2.2.29): use the normalisation procedure.

Prepare the solutions immediately before use.

Test solution. Dilute an amount of the preparation to be examined equivalent to 50 000 IU of tylosin phosphate to 200 ml with a mixture of equal volumes of *acetonitrile R* and *water R*.

Reference solution (a). Dissolve 20 mg of *tylosin CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (b). Dissolve 2 mg of *tylosin CRS* and 2 mg of *tylosin D CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 100.0 ml with a mixture of equal volumes of *acetonitrile R* and *water R*. Dilute 1.0 ml of this solution to 10.0 ml with the same mixture of solvents.

Column:

- **size:** *l* = 0.20 m, Ø = 4.6 mm;
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm);
- **temperature:** 35 °C.

Mobile phase: mix 40 volumes of *acetonitrile R* and 60 volumes of a 200 g/l solution of *sodium perchlorate R* previously adjusted to pH 2.5 using a 36.5 g/l solution of *hydrochloric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 290 nm.

Injection: 20 µl.

Run time: 1.8 times the retention time of tylosin A.

Relative retention with reference to tylosin A (retention time = about 12 min): impurity A = about 0.35; tylosin C = about 0.5; tylosin B = about 0.6; tylosin D = about 0.85; impurity B = about 0.9 (use the chromatogram supplied with *tylosin CRS* to identify the peaks due to tylosin B and tylosin C).

System suitability: reference solution (b):

- **resolution:** minimum 2.0 between the peaks due to tylosin D and tylosin A.

Limits:

- **tylosin A:** minimum 80.0 per cent;
- **sum of the contents of tylosin A, tylosin B, tylosin C and tylosin D:** minimum 95.0 per cent;
- **disregard limit:** area of the principal peak in the chromatogram obtained with reference solution (c).

Tyramine. In a 25.0 ml volumetric flask, dissolve an amount of the preparation to be examined equivalent to 50 000 IU of tylosin phosphate in 5.0 ml of a 3.4 g/l solution of *phosphoric acid R*. Add 1.0 ml of *pyridine R* and 2.0 ml of a saturated solution of *ninhydrin R* (about 40 g/l). Close the flask with aluminium foil and heat in a water-bath at 85 °C for 20-30 min. Cool the solution rapidly and dilute to 25.0 ml with *water R*. Mix and measure immediately the absorbance (2.2.25) of the solution at 570 nm using a blank solution as the compensation liquid.

The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 35 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R*.

Phosphate: 8.5 per cent to 10.0 per cent of PO₄, calculated with reference to the dry residue (see Assay).

Test solution. Dissolve an amount of the preparation to be examined equivalent to 200 000 IU of tylosin phosphate in 50 ml of *water R*. Add 5.0 ml of *dilute sulphuric acid R* and dilute to 100.0 ml with *water R*. To 2.0 ml of this solution add successively, mixing after each addition, 10.0 ml of *water R*, 5.0 ml of *ammonium molybdate reagent R2*, 1.0 ml of *hydroquinone solution R* and 1.0 ml of a 200 g/l solution of *sodium metabisulphite R*. Allow to stand for at least 20 min and dilute to 50.0 ml with *water R*. Mix thoroughly.

Reference solution (a). To 1.0 ml of a standard solution containing 0.430 g/l of *potassium dihydrogen phosphate R* (corresponds to 300 ppm of PO₄) add successively, mixing after each addition, 10.0 ml of *water R*, 5.0 ml of *ammonium molybdate reagent R2*, 1.0 ml of *hydroquinone solution R* and 1.0 ml of a 200 g/l solution of *sodium metabisulphite R*. Allow to stand for at least 20 min and dilute to 50.0 ml with *water R*. Mix thoroughly.

Reference solution (b). Prepare as reference solution (a) but using 2.0 ml of the standard solution.

Reference solution (c). Prepare as reference solution (a) but using 5.0 ml of the standard solution.

Compensation liquid. Prepare as reference solution (a) but omitting the standard solution.

Measure the absorbance (2.2.25) of the test solution and of the reference solutions at 650 nm.

Draw a calibration curve with the absorbances of the 3 reference solutions as a function of the quantity of phosphate in the solutions and read from the curve the quantity of phosphate in the test solution.

Determine the percentage content of PO₄, calculated with reference to the dry residue (see Assay).

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2).

Use *tylosin CRS* as the reference substance. Calculate the potency from the mass of the dry residue and the activity of the solution.

Dry residue. Dry 3.0 g of the preparation to be examined *in vacuo* at 60 °C for 3 h and weigh.

STORAGE

Protected from light, at a temperature of 2 °C to 8 °C.

LABELLING

The label states:

- the concentration of the solution in International Units per milligram of preparation.

IMPURITIES

A. desmycinosyltylosin A,

B. (1R,2S,3S,4R,8R,9R,10E,12E,15R,16RS)-9-[[[(6-deoxy-2,3-di-O-methyl-β-D-allopyranosyl)oxy]methyl]-2-[[[3,6-dideoxy-4-O-(2,6-dideoxy-3-C-methyl-α-L-ribo-hexopyranosyl)-3-(dimethylamino)-β-D-glucopyranosyl]oxy]-8-ethyl-4,16-dihydroxy-3,11,15-trimethyl-7-oxabicyclo[13.2.1]octadeca-10,12-diene-6,14-dione (tylosin A aldol).

01/2005:1274 TESTS

TYLOSIN TARTRATE FOR VETERINARY USE

Tylosini tartras ad usum veterinarium

DEFINITION

Tylosin tartrate for veterinary use is a tartrate of a mixture of macrolide antibiotics produced by a strain of *Streptomyces fradiae* or by any other means. The main component of the mixture is (4*R*,5*S*,6*S*,7*R*,9*R*,11*E*,13*E*,15*R*,16*R*)-15-[[[(6-deoxy-2,3-di-*O*-methyl-β-*D*-allopyranosyl)oxy]methyl]-6-[[[3,6-dideoxy-4-*O*-(2,6-dideoxy-3-*C*-methyl-α-*L*-ribo-hexopyranosyl)-3-(dimethylamino)-β-*D*-glucopyranosyl]oxy]-16-ethyl-4-hydroxy-5,9,13-trimethyl-7-(2-oxoethyl)oxacyclohexadeca-11,13-diene-2,10-dione (tylosin A, tartrate *M_r* 1982). Tylosin B (desmycosin, tartrate *M_r* 1694), tylosin C (macrocin, tartrate *M_r* 1954) and tylosin D (relomycin, tartrate *M_r* 1986) may also be present. They contribute to the potency of the substance to be examined, which is not less than 800 IU/mg, calculated with reference to the dried substance.

CHARACTERS

An almost white or slightly yellow, hygroscopic powder, freely soluble in water and in methylene chloride, slightly soluble in ethanol. It dissolves in dilute solutions of mineral acids.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of tylosin tartrate*.
- Examine the chromatograms obtained in the test for composition. The retention time and size of the principal peak in the chromatogram obtained with the test solution are the same as those of the principal peak in the chromatogram obtained with reference solution (a).
- Dissolve about 30 mg in a mixture of 0.15 ml of *water R*, 2.5 ml of *acetic anhydride R* and 7.5 ml of *pyridine R*. Allow to stand for about 10 min. A green colour is produced.

pH (2.2.3). Dissolve 0.25 g in 10 ml of *carbon dioxide-free water R*. The pH of the solution is 5.0 to 7.2.

Composition. Examine by liquid chromatography (2.2.29). Prepare the solutions immediately before use.

The content of tylosin A is not less than 80.0 per cent and the sum of the contents of tylosin A, tylosin B, tylosin C and tylosin D is not less than 95.0 per cent.

Test solution. Dissolve 20.0 mg of the substance to be examined in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (a). Dissolve 20.0 mg of *tylosin CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 100.0 ml with the same mixture of solvents.

Reference solution (b). Dissolve 2 mg of *tylosin CRS* and 2 mg of *tylosin D CRS* in a mixture of equal volumes of *acetonitrile R* and *water R* and dilute to 10 ml with the same mixture of solvents.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.20 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 μm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 40 volumes of *acetonitrile R* and 60 volumes of a 200 g/l solution of *sodium perchlorate R* previously adjusted to pH 2.5 using 1 *M hydrochloric acid*,
- as detector a spectrophotometer set at 290 nm, maintaining the temperature of the column at 35 °C.

Inject 20 μl of reference solution (b). When the chromatograms are recorded in the prescribed conditions, the retention time of tylosin A is about 12 min. The test is not valid unless, in the chromatogram obtained, the resolution between the peaks corresponding to tylosin A and tylosin D is at least 2.0. Inject 20 μl of the test solution and 20 μl of reference solution (a). Calculate the percentage content of the constituents from the areas of the peaks in the chromatogram obtained with the test solution by the normalisation procedure.

Tyramine. In a 25.0 ml volumetric flask, dissolve 50.0 mg of the substance to be examined in 5.0 ml of a 3.4 g/l solution of *phosphoric acid R*. Add 1.0 ml of *pyridine R* and 2.0 ml of a saturated solution of *ninhydrin R* (about 40 g/l). Close the flask with a piece of aluminium foil and heat in a water-bath at 85 °C for 30 min. Cool the solution rapidly and dilute to 25.0 ml with *water R*. Mix and measure immediately the absorbance (2.2.25) of the solution at 570 nm using a blank solution as the compensation liquid. The absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 35 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R* (0.35 per cent). If intended for use in the manufacture of parenteral dosage forms, the absorbance is not greater than that of a standard prepared at the same time and in the same manner using 5.0 ml of a 15 mg/l solution of *tyramine R* in a 3.4 g/l solution of *phosphoric acid R* (0.15 per cent).

Loss on drying (2.2.32). Not more than 4.5 per cent, determined on 1.000 g by drying at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14). Not more than 2.5 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2). Use *tylosin CRS* as the reference substance.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

A. desmynosyltylosin,

B. tylosin A aldol.

01/2005:1161

TYROSINE

Tyrosinum

 $C_9H_{11}NO_3$ M_r 181.2

DEFINITION

Tyrosine contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (S)-2-amino-3-(4-hydroxyphenyl)propanoic acid, calculated with reference to the dried substance.

CHARACTERS

A white crystalline powder or colourless crystals, very slightly soluble in water, practically insoluble in alcohol. It dissolves in dilute mineral acids and in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D, E.

- A. It complies with the test for specific optical rotation (see Tests).
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with tyrosine CRS. Examine the substances prepared as discs.

- C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- D. To about 50 mg add 1 ml of *dilute nitric acid R*. A dark red colour is produced within 15 min.
- E. Dissolve about 30 mg in 2 ml of *dilute sodium hydroxide solution R*. Add 3 ml of a freshly prepared mixture of equal volumes of a 100 g/l solution of *sodium nitrite R* and a solution of 0.5 g of *sulphanilic acid R* in a mixture of 6 ml of *hydrochloric acid R1* and 94 ml of *water R*. An orange-red colour is produced.

TESTS

Appearance of solution. Dissolve 0.5 g in *dilute hydrochloric acid R* and dilute to 20 ml with the same acid. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 1.25 g in a mixture of equal volumes of *dilute hydrochloric acid R* and *water R* and dilute to 25.0 ml with the same mixture of solvents. The specific optical rotation is –11.0 to –12.3, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute ammonia R2* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *tyrosine CRS* in 1 ml of *dilute ammonia R2* and dilute to 50 ml with *water R*.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *tyrosine CRS* and 10 mg of *phenylalanine CRS* in 1 ml of *dilute ammonia R2* and dilute to 25 ml with *water R*.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 30 volumes of *concentrated ammonia R1* and 70 volumes of *propanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dissolve 0.25 g in 3 ml of *dilute nitric acid R* and dilute to 15 ml with *water R*. The solution complies with the limit test for chlorides, without any further addition of nitric acid (200 ppm).

Sulphates (2.4.13). Dissolve with gentle heating, 0.5 g in 5 ml of *dilute hydrochloric acid R* and dilute to 15 ml with *distilled water R*. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 0.10 g complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.2 ml of *ammonium standard solution (100 ppm NH₄) R*. Replace the *heavy magnesium oxide R* by 2.0 ml of *strong sodium hydroxide solution R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for

3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb R)*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.150 g in 5 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 18.12 mg of C₉H₁₁NO₃.

STORAGE

Store protected from light.

01/2005:1662

TYROTHRICIN

Tyrothricinum

Gramicidin	Mol. formula	<i>M_r</i>	X	Y

E	C ₆₆ H ₈₈ N ₁₃ O ₁₂	1255	L-Phe	D-Phe	L-Phe

DEFINITION

Mixture of antimicrobial linear and cyclic polypeptides, isolated from the fermentation broth of *Brevibacillus brevis* Dubos. It consists mainly of gramicidins and tyrocidins as described above; other related compounds may be present in smaller amounts.

Potency: 180 IU/mg to 280 IU/mg (dried substance).

CHARACTERS

Appearance: white or almost white powder.

Solubility: practically insoluble in water, soluble in alcohol and in methanol.

IDENTIFICATION

First identification: B.

Second identification: A.

A. Thin-layer chromatography (2.2.27).

Test solution. Dissolve 5 mg of the substance to be examined in 4.0 ml of *alcohol R*.

Reference solution. Dissolve 5 mg of *tyrothricin CRS* in 4.0 ml of *alcohol R*.

Plate: TLC silica gel *F₂₅₄* plate *R*.

Mobile phase: *methanol R*, *butanol R*, *water R*, *acetic acid R*, *butyl acetate R* (2.5:7.5:12:20:40 V/V/V/V/V).

Application: 1 µl.

Development: over 2/3 of the plate.

Drying: in a current of warm air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: the principal spots or groups of principal spots in the chromatogram obtained with the test solution are similar in position and size to the principal spots or groups of principal spots in the chromatogram obtained with the reference solution. The upper group corresponds to gramicidins, the lower group to tyrocidins.

Detection B: spray with *dimethylaminobenzaldehyde solution R2*. Heat the plate in a current of warm air until the spots appear.

System suitability: reference solution:

- the chromatogram shows 2 clearly separated spots or groups of spots.

Results B: the principal spots or groups of principal spots in the chromatogram obtained with the test solution are similar in position, colour and size to the principal spots or groups of principal spots in the chromatogram obtained with the reference solution. The upper group corresponds to gramicidins, the lower group to tyrocidins.

B. It complies with the test for composition (see Tests).

TESTS

Composition. Liquid chromatography (2.2.29): use the normalisation procedure. *Prepare the solutions immediately before use.*

Test solution. Dissolve 25 mg of the substance to be examined in 10 ml of *methanol R* and dilute to 25.0 ml with the mobile phase.

Reference solution (a). Dissolve 25 mg of *tyrothricin CRS* in 10 ml of *methanol R* and dilute to 25.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of reference solution (a) to 50.0 ml with the mobile phase.

Column:

- *size:* *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase:* octadecylsilyl silica gel for chromatography *R* (5 µm),
- *temperature:* 60 °C.

Mobile phase: 0.79 g/l solution of *ammonium sulphate R*, *methanol R* (25:75 V/V).

Flow rate: 1.2 ml/min.

Detection: spectrophotometer at 280 nm.

Injection: 25 µl.

Run time: 6 times the retention time of gramicidin A1. Use the chromatogram obtained with reference solution (a) and the chromatogram supplied with *tyrothricin CRS* to identify the peaks due to gramicidin A1, gramicidin A2 and the tyrocidins.

Relative retention with reference to gramicidin A1 (retention time = about 10 min): gramicidin C1 = about 0.8; gramicidin C2 = about 0.9; gramicidin A2 = about 1.1; tyrocidins = about 1.5 to 6.

System suitability: reference solution (a):

- **resolution:** minimum 1.5 between the peaks due to gramicidin A1 and gramicidin A2.

Composition:

- **sum of gramicidins:** 25 per cent to 50 per cent,
- **sum of tyrocidins:** 50 per cent to 70 per cent,
- **total:** minimum 85 per cent,

- **disregard limit:** the sum of the areas of the peaks due to gramicidins in the chromatogram obtained with reference solution (b).

Loss on drying (2.2.32): maximum 4.0 per cent, determined on 1.000 g by drying under high vacuum at 60 °C for 3 h.

Sulphated ash (2.4.14): maximum 1.5 per cent, determined on 1.0 g.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2) using the turbidimetric method. Use *gramicidin CRS* as the reference substance.

Test solution. Prepare a solution of tyrothricin containing about the same amount of gramicidin as the corresponding solution of *gramicidin CRS* i.e. 5 times more concentrated.

STORAGE

In an airtight container, protected from light.

01/2005:1578 *Relative retention* with reference to ubidecarenone (retention time = about 12 min): impurity D = about 0.67.

UBIDECARENONE

Ubidecarenonum

$C_{59}H_{90}O_4$

M_r 863

DEFINITION

2-[(all-*E*)-3,7,11,15,19,23,27,31,35,39-Decamethyltetracont-2,6,10,14,18,22,26,30,34,38-decaenyl]-5,6-dimethoxy-3-methylbenzene-1,4-dione.

Content: 97.0 per cent to 103.0 per cent.

CHARACTERS

Appearance: yellow or orange, crystalline powder.

Solubility: practically insoluble in water, soluble in acetone, very slightly soluble in ethanol.

It gradually decomposes and darkens on exposure to light.
mp: about 48 °C.

Carry out all operations avoiding exposure to light.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: ubidecarenone CRS.

B. Examine the chromatograms obtained in the test for related substances.

Results: the retention time of the principal peak in the chromatogram obtained with the test solution is similar to that of the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Related substances. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 25.0 ml of *ethanol R* by heating at about 50 °C for 2 min. Allow to cool.

Reference solution (a). Dissolve 5 mg of ubidecarenone CRS in 5 ml of *ethanol R* by heating at about 50 °C for 2 min. Allow to cool.

Reference solution (b). Dissolve 2 mg of ubidecarenone impurity D CRS in 2 ml of the test solution by heating at about 50 °C for 2 min. Allow to cool. Dilute 1 ml to 50 ml with *ethanol R*.

Reference solution (c). Dilute 1.0 ml of the test solution to 100.0 ml with *ethanol R*.

Column:

- size: $l = 0.15$ m, $\varnothing = 4.6$ mm,
- stationary phase: octadecylsilyl silica gel for chromatography R (5 μ m).

Mobile phase: *ethanol R*, *methanol R2* (20:80 V/V).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 10 μ l.

Run time: 2 times the retention time of ubidecarenone.

System suitability: reference solution (b):

- *resolution*: minimum 6.5 between the peaks due to impurity D and to ubidecarenone.

Limits:

- *any impurity*: not more than half the area of the principal peak in the chromatogram obtained with reference solution (c) (0.5 per cent),
- *total*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (1.0 per cent),
- *disregard limit*: 0.05 times the area of the principal peak in the chromatogram obtained with reference solution (c) (0.05 per cent).

Impurity F. Liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in 25.0 ml of *hexane R*.

Reference solution (a). Dissolve 10.0 mg of ubidecarenone for system suitability CRS in 10.0 ml of *hexane R*.

Reference solution (b). Dilute 1 ml of the test solution to 100.0 ml with *hexane R*.

Column:

- size: $l = 0.25$ m, $\varnothing = 4.0$ mm,
- stationary phase: silica gel for chromatography R (7 μ m).

Mobile phase: *ethyl acetate R*, *hexane R* (3:97 V/V).

Flow rate: 2 ml/min.

Detection: spectrophotometer at 275 nm.

Injection: 20 μ l.

Run time: 1.2 times the retention time of ubidecarenone.

Relative retention with reference to ubidecarenone (retention time = about 10 min): impurity F = about 0.85.

System suitability: reference solution (a):

- *resolution*: minimum 1.5 between the peaks due to impurity F and to ubidecarenone.

Limit:

- *impurity F*: not more than 0.5 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.5 per cent).

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 50.0 mg in 1.0 ml of *hexane R* and dilute to 50.0 ml with *ethanol R*. Dilute 2.0 ml of the solution to 50.0 ml with *ethanol R*. Measure the absorbance (2.2.25) at the maximum at 275 nm. Calculate the content of $C_{59}H_{90}O_4$ taking the specific absorbance to be 169.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E, F.

A. 2,3-dimethoxy-5-methylbenzene-1,4-diol,

- B. $n = 5$: 2-[(all-*E*)-3,7,11,15,19,23,27-heptamethyloctadocosa-2,6,10,14,18,22,26-heptaenyl]-5,6-dimethoxy-3-methylbenzene-1,4-dione (ubiquinone-7),
- C. $n = 6$: 5,6-dimethoxy-3-methyl-2-[(all-*E*)-3,7,11,15,19,23,27,31-octamethyldotriaconta-2,6,10,14,18,22,26,30-octaenyl]benzene-1,4-dione (ubiquinone-8),
- D. $n = 7$: 5,6-dimethoxy-3-methyl-2-[(all-*E*)-3,7,11,15,19,23,27,31,35-nonamethylhexatriaconta-2,6,10,14,18,22,26,30,34-nonaenyl]benzene-1,4-dione (ubiquinone-9),

- E. (2*RS*)-7,8-dimethoxy-2,5-dimethyl-2-[(all-*E*)-4,8,12,16,20,24,28,32,36-nonamethylheptatriaconta-3,7,11,15,19,23,27,31,35-nonaenyl]-2*H*-1-benzopyran-6-ol (ubiquinol-9),

- F. 2-[(2*Z*,6*E*,10*E*,14*E*,18*E*,22*E*,26*E*,30*E*,34*E*,38*E*)-3,7,11,15,19,23,27,31,35,39-decamethyl-2,6,10,14,18,22,26,30,34,38-tetracontadecaenyl]-5,6-dimethoxy-3-methylbenzene-1,4-dione (ubidecarenone (*Z*)-isomer).

01/2005:0461

UNDECYLENIC ACID

Acidum undecylenicum

 $C_{11}H_{20}O_2$ M_r 184.3

DEFINITION

Undecylenic acid contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of undec-10-enoic acid.

CHARACTERS

A white or very pale yellow, crystalline mass or colourless or pale yellow liquid, practically insoluble in water, freely soluble in alcohol and in fatty and essential oils.

IDENTIFICATION

- A. Refractive index (2.2.6): 1.447 to 1.450, determined at 25 ± 0.5 °C.
- B. Freezing point (2.2.18): 21 °C to 24 °C.

- C. To 2.0 g add 2 ml of freshly distilled *aniline R* and boil under a reflux condenser for 10 min. Allow to cool and add 30 ml of *ether R*. Shake with three quantities, each of 20 ml, of *dilute hydrochloric acid R* and then with 20 ml of *water R*. Evaporate the organic layer to dryness on a water-bath. The residue, after recrystallisation twice from *alcohol (70 per cent V/V) R* and drying *in vacuo* for 3 h, melts (2.2.14) at 66 °C to 68 °C.
- D. Dissolve 0.1 g in a mixture of 2 ml of *dilute sulphuric acid R* and 5 ml of *glacial acetic acid R*. Add dropwise 0.25 ml of *potassium permanganate solution R*. The colour of the potassium permanganate is discharged.

TESTS

Peroxide value (2.5.5). Not more than 10.

Fixed and mineral oils. To 1.0 g add 5 ml of *sodium carbonate solution R* and 25 ml of *water R* and boil for 3 min. The hot solution is not more opalescent than reference suspension II (2.2.1).

Water-soluble acids. To 1.0 g add 20 ml of *water R* heated to 35 °C to 45 °C and shake for 2 min. Cool and filter the aqueous layer through a moistened filter. To 10 ml of the filtrate add 0.1 ml of *phenolphthalein solution R*. Not more than 0.1 ml of 0.1 *M sodium hydroxide* is required to change the colour of the indicator.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 0.50 g.

Degree of unsaturation. Dissolve 85.0 mg in a mixture of 5 ml of *dilute hydrochloric acid R* and 30 ml of *glacial acetic acid R*. Using 0.05 ml of *indigo carmine solution R1*, added towards the end of the titration, as indicator, titrate with 0.0167 *M bromide-bromate* until the colour changes from blue to yellow. 8.9 ml to 9.4 ml of 0.0167 *M bromide-bromate* is required. Carry out a blank titration.

ASSAY

Dissolve 0.750 g in 10 ml of *alcohol R*. Using 0.1 ml of *phenolphthalein solution R* as indicator, titrate with 0.5 *M sodium hydroxide* until a pink colour is obtained.

1 ml of 0.5 *M sodium hydroxide* is equivalent to 92.14 mg of $C_{11}H_{20}O_2$.

STORAGE

Store in a non-metallic container, protected from light.

01/2005:0743

UREA

Ureum

 CH_4N_2O M_r 60.1

DEFINITION

Carbamide.

Content: 98.5 per cent to 101.5 per cent (dried substance).

CHARACTERS

Appearance: white, crystalline powder or transparent crystals, slightly hygroscopic.

Solubility: very soluble in water, soluble in alcohol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, B.

Second identification: A, C, D.

A. Melting point (2.2.14): 132 °C to 135 °C.

B. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: urea CRS.

C. Dissolve 0.1 g in 1 ml of *water R*. Add 1 ml of *nitric acid R*. A white, crystalline precipitate is formed.

D. Heat 0.5 g in a test tube until it liquefies and the liquid becomes turbid. Cool, dissolve in a mixture of 1 ml of *dilute sodium hydroxide solution R* and 10 ml of *water R* and add 0.05 ml of *copper sulphate solution R*. A reddish-violet colour is produced.

TESTS

Solution S. Dissolve 10.0 g in *water R* and dilute to 50 ml with the same solvent.

Appearance of solution. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

To 2.5 ml of solution S add 7.5 ml of *water R*.

Alkalinity. To 2.5 ml of solution S add 7.5 ml of *water R*, 0.1 ml of *methyl red solution R* and 0.4 ml of 0.01 M *hydrochloric acid*. The solution is red to orange.

Biuret: maximum 0.1 per cent.

To 10 ml of solution S add 5 ml of *water R*, 0.5 ml of a 5 g/l solution of *copper sulphate R* and 0.5 ml of *strong sodium hydroxide solution R*. Allow to stand for 5 min. Any reddish-violet colour in the solution is not more intense than that in a standard prepared at the same time in the same manner using 10 ml of a 0.2 g/l solution of *biuret R*.

Ammonium (2.4.1): maximum 500 ppm, determined on 0.1 ml of solution S.

Heavy metals (2.4.8): maximum 10 ppm.

Dilute 10 ml of solution S to 20 ml with *water R*. 12 ml of the solution complies with limit test A. Prepare the standard using *lead standard solution (1 ppm Pb) R*.

Loss on drying (2.2.32): maximum 1.0 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 1 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.2000 g in *water R* and dilute to 50.0 ml with the same solvent. Introduce 1.0 ml of this solution into a combustion flask. Add 4 g of a powdered mixture of 100 g of *dipotassium sulphate R*, 5 g of *copper sulphate R* and 2.5 g of *selenium R*, and 3 glass beads. Wash any adhering particles from the neck into the flask with 5 ml of *sulphuric acid R*, allowing it to run down the sides of the flask, and mix the contents by rotation. Close the mouth of the flask loosely, for example by means of a glass bulb with a short stem, to avoid excessive loss of sulphuric acid. Heat gradually at first, then increase the temperature until there is vigorous boiling with condensation of sulphuric acid in the neck of the flask; take precautions to prevent the upper part of the flask from becoming overheated. Continue the heating for 30 min. Cool, dissolve the solid material by cautiously adding to the mixture 25 ml of *water R*, cool again and place in a steam-distillation apparatus. Add 30 ml of *strong sodium hydroxide solution R* and distil immediately by passing steam through the mixture. Collect the distillate in 15 ml of a 40 g/l solution of *boric acid R* to which has been added 0.2 ml of *methyl red mixed solution R* and enough *water R* to cover the tip of the condenser. Towards

the end of the distillation, lower the receiver so that the tip of the condenser is above the surface of the acid. Take precautions to prevent any water on the outer surface of the condenser from reaching the contents of the receiver. Titrate the distillate with 0.01 M *sulphuric acid*.

1 ml of 0.01 M *sulphuric acid* is equivalent to 0.6006 mg of CH₄N₂O.

STORAGE

In an airtight container.

01/2005:0958

UROFOLLITROPIN

Urofollitropinum

DEFINITION

Urofollitropin is a dry preparation containing menopausal gonadotrophin obtained from the urine of post-menopausal women. It has follicle-stimulating activity and no or virtually no luteinising activity. The potency is not less than 90 International Units of follicle-stimulating hormone (hFSH) per milligram. The ratio of units of luteinising hormone (interstitial-cell-stimulating hormone) [hLH(ICSH)] to units of follicle-stimulating hormone is not more than 1/60.

PRODUCTION

It may be prepared by a suitable fractionation procedure followed by immunoaffinity chromatography. It is prepared in conditions designed to minimise microbial contamination. The manufacturing process must have been shown to reduce any viral contamination such as hepatitis virus or HIV by appropriate validated methods.

CHARACTERS

Appearance: almost white or slightly yellowish powder.

Solubility: soluble in water.

IDENTIFICATION

When administered as prescribed in the assay it causes enlargement of the ovaries of immature female rats.

TESTS

Hepatitis virus antigens. Examined by a suitably sensitive immunochemical method (2.7.1), hepatitis virus antigens are not detected.

HIV antigen. Examined by a suitably sensitive immunochemical method (2.7.1), HIV antigen is not detected.

Residual luteinising activity. The International Units of FSH and LH are the activities contained in stated amounts of the International Standard of human urinary follicle-stimulating hormone and luteinising hormone (interstitial-cell-stimulating hormone) which consists of a mixture of a freeze-dried extract of urine of post-menopausal women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation. Use immature female rats approximately 21 days old and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 4 equal groups of at least 6 animals. If sets of 4 litter mates are available, assign one litter mate at random from each set to each group and mark according to litter.

Inject subcutaneously into each rat 50 IU of *serum gonadotrophin R* on the first day and 25 IU of *chorionic gonadotrophin R* on the fourth day, each in 0.5 ml of *phosphate-albumin buffered saline pH 7.2 R*.

Choose 3 doses of the reference preparation such that the smallest dose produces a depletion of the ovarian ascorbic acid content in all the rats and the largest dose does not produce a maximal depletion in all the rats. Use doses in geometric progression; as an initial approximation, total doses of 0.5 IU, 1.0 IU and 2.0 IU may be tried although the dose to be used will depend on the sensitivity of the animals.

Choose a dose of the preparation to be examined expected to contain 60X IU of follicle-stimulating hormone (hFSH), in which X = the number of IU of hLH in the middle dose of the reference preparation.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation in 1.0 ml of *phosphate-albumin buffered saline pH 7.2 R*. Inject into a tail vein to each separate group of rats 6 days after the injection of chorionic gonadotrophin. Exactly 4 h after the injection, kill the rats and remove the ovaries from each animal. Remove any extraneous fluid and tissue from the ovaries and weigh the ovaries immediately.

Treat the combined ovaries from each rat separately, as follows. Crush and homogenise within 2 min in a freshly prepared 25 g/l solution of *metaphosphoric acid R* at a temperature of 4 °C and dilute to 7 ml with the same solution. Allow the homogenate to stand for 30 min at 4 °C and centrifuge at 4 °C at approximately 2500 g. Filter the supernatant liquid, if necessary, through a 0.22 µm filter.

Prepare a fresh solution consisting of a mixture of 2 ml of a 45.3 g/l solution of *sodium acetate R* adjusted to pH 7 with *acetic acid R*, 3 ml of *water R* and 2 ml of *dichlorophenolindophenol standard solution R*. Mix 2 ml of this solution with 2 ml of the clear supernatant liquid. 30 s after mixing, measure the absorbance (2.2.25) of the solution at the maximum at about 520 nm. Use as reference a solution with a known content of *ascorbic acid CRS* in a 25 g/l solution of *metaphosphoric acid R*, treated by the same process.

Calculate the amount of ascorbic acid from the ascorbic acid standard curve obtained and express in milligrams per 0.1 g of ovary to obtain the ascorbic acid content of the ovaries. Calculate the mean and its variance of the ascorbic acid content of the ovaries of the rats treated with the preparation to be examined.

For each dose-group of the reference preparation, plot the mean ascorbic acid content of the ovaries as a function of the logarithm of the dose and analyse the regression of the ascorbic acid content on the logarithm of the dose injected, using standard methods of analysis (the method of least squares).

The test is not valid unless:

- the slope constant *b* is significant at the 5 per cent level of significance,
- for the groups treated with the reference preparation, the sum of squares due to linear regression is equal to at least 95 per cent of the total sum of squares of the ascorbic acid content,
- the within-group variance of the ascorbic acid content of the group receiving the preparation to be examined is not significantly different at the 5 per cent level of significance from the within-group variance of the ascorbic acid content of the groups receiving the reference preparation.

The mean ascorbic acid content of the ovaries of the rats treated with the preparation to be examined is not significantly lower than that of the rats treated with the middle dose of the reference preparation (calculated from the regression equation) at the 5 per cent level of significance.

Water (2.5.32): maximum 5.0 per cent.

Bacterial endotoxins (2.6.14, *Method C*): less than 0.40 IU per IU of urofollitropin, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

The follicle-stimulating activity of urofollitropin is estimated by comparing under given conditions its effect in enlarging the ovaries of immature rats treated with chorionic gonadotrophin with the same effect of the International Standard preparation of human urinary follicle-stimulating hormone and luteinising hormone or of a reference preparation calibrated in International Units. The International Units of FSH and LH are the activities contained in stated amounts of the International Standard of human urinary follicle-stimulating hormone and luteinising hormone (interstitial-cell-stimulating hormone) which consists of a mixture of a freeze-dried extract of urine of post-menopausal women with lactose. The equivalence in International Units of the International Standard is stated by the World Health Organisation.

Use immature female rats of the same strain, 19 to 28 days old, differing in age by not more than 3 days and having masses such that the difference between the heaviest and the lightest rat is not more than 10 g. Assign the rats at random to 6 equal groups of at least 5 animals. If sets of 6 litter mates are available, assign one litter mate from each set to each group and mark according to litter.

Choose 3 doses of the reference preparation and 3 doses of the preparation to be examined such that the smallest dose produces a positive response in some of the rats and the largest dose does not produce a maximal response in all the rats. Use doses in geometric progression and as an initial approximation total doses of 1.5 IU, 3.0 IU and 6.0 IU may be tried although the dose will depend on the sensitivity of the animals used, which may vary widely.

Dissolve separately the total quantities of the preparation to be examined and of the reference preparation corresponding to the daily doses to be used in sufficient *phosphate-albumin buffered saline pH 7.2 R* such that the daily dose is administered in a volume of about 0.5 ml. The buffer solution shall contain in the daily dose not less than 14 IU of chorionic gonadotrophin to ensure complete luteinisation. Add a suitable antimicrobial preservative such as 4 g/l of phenol or 0.02 g/l of thiomersal. Store the solutions at 5 ± 3 °C.

Inject subcutaneously into each rat the daily dose allocated to its group. Repeat the injection of each dose 24 h and 48 h after the first injection. About 24 h after the last injection, kill the rats and remove the ovaries from each animal. Remove any extraneous fluid and tissue from the ovaries and weigh the 2 combined ovaries of each animal immediately. Calculate the results by the usual statistical methods, using the mass of the 2 combined ovaries as the response. (The precision of the assay may be improved by a suitable correction of the organ mass with reference to the mass of the animal from which it was taken; an analysis of covariance may be used).

The estimated potency is not less than 80 per cent and not more than 125 per cent of the stated potency. The confidence limits (*P* = 0.95) of the estimated potency are not less than 64 per cent and not more than 156 per cent of the stated potency.

STORAGE

In an airtight, tamper-proof container, protected from light, at a temperature of 2 °C to 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the activity expressed in International Units of follicle-stimulating hormone per container,
- the potency expressed in International Units of follicle-stimulating hormone per milligram,
- where applicable, that the substance is free from bacterial endotoxins.

01/2005:0695

UROKINASE

Urokinasum

DEFINITION

Urokinase is an enzyme, obtained from human urine, that activates plasminogen. It consists of a mixture of low-molecular-mass (LMM) (M_r 33 000) and high-molecular-mass (HMM) (M_r 54 000) forms, the high-molecular-mass form being predominant. The potency is not less than 70 000 International Units per milligram of protein.

PRODUCTION

It is produced by validated methods of manufacturing designed to minimise or eliminate microbial and viral contamination and vasoactive substances; in particular, adequate measures to inactivate viruses are taken, such as heating of the substance in solution at 60 °C for 10 h.

CHARACTERS

A white or almost white, amorphous powder, soluble in water.

IDENTIFICATION

- Place separately in two haemolysis tubes 0.5 ml of citrated human plasma and 0.5 ml of citrated bovine plasma and maintain in a water-bath at 37 °C. To each tube add 0.1 ml of a solution containing a quantity of the substance to be examined equivalent to 1000 IU/ml in *phosphate buffer solution pH 7.4 R* and 0.1 ml of a solution containing a quantity of *humanthrombin R* equivalent to 20 IU/ml in *phosphate buffer solution pH 7.4 R*. Shake immediately. In both tubes, a clot forms and lyses within 30 min.
- Carry out identification by a suitable immunodiffusion test.

TESTS

Appearance of solution. Dissolve 10 mg in 10 ml of *water R*. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

Hepatitis B surface antigen. Examine by a suitably sensitive method such as radio-immunoassay. Hepatitis B surface antigen is not detected.

Thromboplastic contaminants

Test solutions. Dissolve suitable quantities of the substance to be examined in *barbital buffer solution pH 7.4 R* to obtain solutions with activities of 5000 IU/ml, 2500 IU/ml, 1250 IU/ml, 625 IU/ml and 312 IU/ml.

To each of six haemolysis tubes 1 cm in internal diameter add 0.1 ml of *citrated rabbit plasma R*. Allocate the test solutions one to each of five of the tubes; add to each tube 0.1 ml of the solution allocated to it and to the sixth tube add 0.1 ml of *barbital buffer solution pH 7.4 R* (blank). Incubate the tubes at 25 ± 0.5 °C for 5 min and add 0.1 ml of a 3.675 g/l solution of *calcium chloride R*. Measure with a stop-watch

the coagulation time for each tube. Plot the shortening of the recalcification time (clotting time of the blank minus clotting time measured) against log concentration in International Units. Extrapolate the best-fitting straight line through the five points until it reaches the log-concentration axis. The urokinase activity at the intersection point, which represents the limit concentration for coagulant activity (zero coagulant activity), is not less than 150 IU/ml.

Molecular fractions. Examine by size-exclusion chromatography (2.2.30).

Test solution. Dissolve about 1 mg of the substance to be examined in 1.0 ml of *0.02 M phosphate buffer pH 8.0 R*. Prepare immediately before use.

The chromatographic procedure may be carried out using:

- a column 0.9 m long and 16 mm in internal diameter packed with *cross-linked dextran for chromatography R3*,
- as mobile phase at a flow rate of 6 ml/h a 17.5 g/l solution of *sodium chloride R* in *0.02 M phosphate buffer solution pH 8.0 R*,

equilibrating the column and operating at 5 °C. Apply the test solution to the head of the column rinsing twice with 0.5 ml portions of the buffer and carry out the elution. The eluate may be collected in fractions of 1 ml. Measure the absorbance (2.2.25) of the eluate at the maximum at 280 nm and plot the individual values on a graph. Draw perpendicular lines towards the axis of the abscissae from the minima before the HMM peak, between the HMM and the LMM peaks, and after the LMM peak, thus identifying the fractions to be considered in calculating the HMM/LMM activity ratio. Pool the HMM fractions and, separately, the LMM fractions. Determine separately the urokinase activity in International Units of each of the fraction pools by the method prescribed under Assay. The ratio of the urokinase activity in the HMM fraction pool to that in the LMM fraction pool is not less than 2.0.

Total protein. Determine the nitrogen content, using 10 mg, by the method of sulphuric acid digestion (2.5.9) and calculate the quantity of protein by multiplying by 6.25.

Pyrogens (2.6.8). If intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of pyrogen, it complies with the test for pyrogens. Inject per kilogram of the rabbit's mass 1.0 ml of a sterile 9 g/l solution of *sodium chloride R* containing a quantity of the substance to be examined equivalent to 20 000 IU/ml.

ASSAY

The potency of urokinase is determined by comparing its capacity to activate plasminogen to form plasmin with the same capacity of a reference preparation of urokinase calibrated in International Units; the formation of plasmin is measured by the determination of the lysis time of a fibrin clot in given conditions.

The International Unit is the activity contained in a stated amount of the International Reference Preparation, which consists of freeze-dried urokinase with lactose. The equivalence in International Units of the International Reference Preparation is stated by the World Health Organisation.

Unless otherwise prescribed, use *phosphate buffer solution pH 7.4 R* containing 30 g/l of *bovine albumin R* for the preparation of the solutions and dilutions used in the assay.

Test solution. Prepare a solution of the substance to be examined expected to have an activity of 1000 IU/ml.

Reference solution. Prepare a solution of a reference preparation having an activity of 1000 IU/ml.

Keep the test solution and the reference solution in iced water and use within 6 h. Prepare three serial 1.5-fold dilutions of the reference preparation such that the longest clot-lysis time is less than 20 min and the shortest clot-lysis time is greater than 3 min. Prepare three similar dilutions of the test solution. Keep the solutions in iced water and use within 1 h. Use twenty-four tubes 8 mm in diameter. Label the tubes T_1 , T_2 and T_3 for the dilutions of the test solution and S_1 , S_2 and S_3 for the dilutions of the reference solution, allocating four tubes to each dilution. Place the tubes in iced water. Into each tube, introduce 0.2 ml of the appropriate dilution, 0.2 ml of *phosphate buffer solution pH 7.4 R* containing 30 g/l of *bovine albumin R* and 0.1 ml of a solution of *humanthrombin R* having an activity of not less than 20 IU/ml. Place the tubes in a water-bath at 37 °C and allow to stand for 2 min to attain temperature equilibrium. Using an automatic pipette, introduce into the bottom of the first tube 0.5 ml of a 10 g/l solution of *bovine euglobulins R*, ensuring mixing. At intervals of 5 s, introduce successively into the remaining tubes 0.5 ml of a 10 g/l solution of *bovine euglobulins R*. Using a stop-watch, measure for each tube the time in seconds that elapses between the addition of the euglobulins solution and the lysis of the clot. Plot the logarithms of the lysis times for the substance to be examined and for the reference preparation against the logarithms of the concentration and calculate the activity of the substance to be examined using the usual statistical methods.

The estimated potency is not less than 90 per cent and not more than 111 per cent of the stated potency. The confidence limits ($P = 0.95$) of the estimated potency are not less than 80 per cent and not more than 125 per cent of the stated potency.

STORAGE

Store in an airtight container, protected from light, at a temperature not exceeding 8 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states:

- the potency in International Units per milligram of protein,
- where applicable, that the contents are apyrogenic.

01/2005:1275

URSODEOXYCHOLIC ACID

Acidum ursodeoxycholicum

$C_{24}H_{40}O_4$

M_r 392.6

DEFINITION

Ursodeoxycholic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 3 α ,7 β -dihydroxy-5 β -cholan-24-oic acid, calculated with reference to the dried substance.

CHARACTERS

A white or almost white powder, very slightly soluble in water, freely soluble in alcohol, slightly soluble in acetone and in methylene chloride.

It melts at about 202 °C.

IDENTIFICATION

First identification: A.

Second identification: B, C.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *ursodeoxycholic acid CRS*. Examine the substances as discs prepared using *potassium bromide R*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 10 mg in 1 ml of *sulphuric acid R*. Add 0.1 ml of *formaldehyde solution R* and allow to stand for 5 min. Add 5 ml of *water R*. The suspension obtained is greenish-blue.

TESTS

Specific optical rotation (2.2.7). Dissolve 0.500 g in *ethanol R* and dilute to 25.0 ml with the same solvent. The specific optical rotation is + 58.0 to + 62.0, calculated with reference to the dried substance.

Related substances. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution (a). Dissolve 0.40 g of the substance to be examined in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (a). Dissolve 40 mg of *ursodeoxycholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents.

Reference solution (b). Dissolve 20 mg of *lithocholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 10 ml with the same mixture of solvents. Dilute 2 ml of the solution to 100 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (c). Dissolve 20 mg of *chenodeoxycholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 50 ml with the same mixture of solvents.

Reference solution (d). Dissolve 20 mg of *cholic acid CRS* in a mixture of 1 volume of *water R* and 9 volumes of *acetone R* and dilute to 100 ml with the same mixture of solvents.

Reference solution (e). Dilute 0.5 ml of test solution (a) to 20 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*. Dilute 1 ml of the solution to 10 ml with a mixture of 1 volume of *water R* and 9 volumes of *acetone R*.

Reference solution (f). Dissolve 10 mg of *ursodeoxycholic acid CRS* in reference solution (c) and dilute to 25 ml with the same solution.

Apply to the plate 5 μ l of each solution. Develop in an unsaturated tank over a path of 15 cm using a mixture of 1 volume of *glacial acetic acid R*, 30 volumes of *acetone R* and 60 volumes of *methylene chloride R*. Dry the plate at 120 °C for 10 min. Spray the plate immediately with a 47.6 g/l solution of *phosphomolybdic acid R* in a mixture

of 1 volume of *sulphuric acid R* and 20 volumes of *glacial acetic acid R* and heat again at 120 °C until blue spots appear on a lighter background. In the chromatogram obtained with test solution (a): any spot corresponding to lithocholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (b) (0.1 per cent); any spot corresponding to chenodeoxycholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (c) (1 per cent); any spot corresponding to cholic acid is not more intense than the principal spot in the chromatogram obtained with reference solution (d) (0.5 per cent); any spot, apart from the principal spot and any spots corresponding to lithocholic acid, chenodeoxycholic acid and cholic acid, is not more intense than the principal spot in the chromatogram obtained with reference solution (e) (0.25 per cent). The test is not valid unless the chromatogram obtained with reference solution (f) shows two clearly separated principal spots.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100-105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.350 g in 50 ml of *alcohol R*, previously neutralised to 0.2 ml of *phenolphthalein solution R*. Add 50 ml of *water R* and titrate with 0.1 M *sodium hydroxide* until a pink colour is obtained.

1 ml of 0.1 M *sodium hydroxide* is equivalent to 39.26 mg of $C_{24}H_{40}O_4$.

IMPURITIES

- A. R = R₁ = R₃ = H, R₂ = OH: chenodeoxycholic acid,
- B. R = R₁ = H, R₂ = R₃ = OH: 3 α ,7 α ,12 α -trihydroxy-5 β -cholan-24-oic acid (cholic acid),
- C. R = R₁ = R₂ = R₃ = H: 3 α -hydroxy-5 β -cholan-24-oic acid (lithocholic acid),
- D. R = R₂ = H, R₁ = R₃ = OH: 3 α ,7 β ,12 α -trihydroxy-5 β -cholan-24-oic acid (ursocholic acid),
- E. R = R₁ = R₂ = H, R₃ = OH: 3 α ,12 α -dihydroxy-5 β -cholan-24-oic acid (deoxycholic acid),
- F. R = R₃ = H, R₁+R₂ = O: 3 α -hydroxy-7-oxo-5 β -cholan-24-oic acid,
- G. R = CH₃, R₁ = OH, R₂ = R₃ = H: methyl 3 α ,7 β -dihydroxy-5 β -cholan-24-oate.

01/2005:0453

VALERIAN ROOT

Valerianae radix

DEFINITION

Valerian root consists of the dried, whole or fragmented underground parts of *Valeriana officinalis* L. *s.l.*, including the rhizome surrounded by the roots and stolons. It contains not less than 5 ml/kg of essential oil for the whole drug and not less than 3 ml/kg of essential oil for the cut drug, both calculated with reference to the dried drug and not less than 0.17 per cent of sesquiterpenic acids expressed as valerenic acid ($C_{15}H_{22}O_2$; M_r 234), calculated with reference to the dried drug.

CHARACTERS

Valerian root has a characteristic odour.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The rhizome is yellowish-grey to pale brownish-grey, obconical to cylindrical, up to about 50 mm long and 30 mm in diameter; the base is elongated or compressed, usually entirely covered by numerous roots. The apex usually exhibits a cup-shaped scar from the aerial parts; stem bases are rarely present. When cut longitudinally, the pith exhibits a central cavity transversed by septa. The roots are numerous, almost cylindrical, of the same colour as the rhizome, 1 mm to 3 mm in diameter and sometimes more than 100 mm long. A few filiform fragile secondary roots are present. The fracture is short. The stolons show prominent nodes separated by longitudinally striated internodes, each 20 mm to 50 mm long, with a fibrous fracture.
- B. Reduce to a powder (355). The powder is pale yellowish-grey to pale greyish-brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows cells containing a pale brown resin or droplets of essential oil; isolated rectangular sclereids with pitted walls 5 µm to 15 µm thick; reticulately-thickened xylem vessels; occasional fragments of cork cells and epidermal cells, some with root hairs. Examine under a microscope using a 50 per cent V/V solution of *glycerol R*. The powder shows numerous fragments of parenchyma with cells, containing single or compound starch granules; the single granules are rounded or elongated, 5 µm to 15 µm in diameter and have sometimes a cleft or radiate hilum; the compound granules have two to six components with an overall diameter of up to 20 µm.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Shake 1.0 g of the powdered drug (355) with 6.0 ml of *methanol R* in a 25 ml flask for 15 min and filter. Rinse the flask and the filter with the aid of a small portion of *methanol R* to obtain 5 ml of filtrate. Evaporate the filtrate to about 2 ml and add 3 ml of a 100 g/l solution of *potassium hydroxide R*. Shake with two quantities, each of 5 ml, of *methylene chloride R*. Allow to separate and discard the lower layer. Heat the aqueous layer in a water-bath at 40 °C for 10 min. Cool and add *dilute hydrochloric acid R* until it gives an acid reaction. Shake with two quantities, each of 5 ml, of *methylene chloride R*. Filter the combined lower

layers over *anhydrous sodium sulphate R*. Evaporate the filtrate to dryness. Dissolve the residue in 1.0 ml of *methylene chloride R*.

Reference solution. Dissolve 5 mg of *fluorescein R* and 5 mg of *Sudan red G R* in 20.0 ml of *methanol R*.

Apply to the plate as bands 20 µl of each solution. Develop over a path of 10 cm using a mixture of 0.5 volumes of *glacial acetic acid R*, 35 volumes of *ethyl acetate R* and 65 volumes of *hexane R*. Allow the plate to dry in air. Examine in daylight. The chromatogram obtained with the reference solution shows in its middle part the red zone of Sudan red G and in its lower part the greenish-yellow zone of fluorescein. Spray the plate with *anisaldehyde solution R*. Examine in daylight while heating at 100 °C to 105 °C for 5 min to 10 min. The chromatogram obtained with the test solution shows a violet-blue zone corresponding to hydroxyvalerenic acid at about the same height as the zone of fluorescein in the chromatogram obtained with the reference solution and also shows a violet zone corresponding to valerenic acid at about the same height as that of the zone due to Sudan red G in the chromatogram obtained with the reference solution. The chromatogram obtained with the test solution shows in the upper half other, mostly less intense, pink to violet zones.

TESTS

Foreign matter (2.8.2). Not more than 5 per cent of stem bases and not more than 2 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 12.0 per cent, determined on 1.000 g of well homogenised powdered drug (355) by drying in an oven at 100 °C to 105 °C, for 2 h.

Total ash (2.4.16). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 5.0 per cent.

ASSAY

Essential oil. Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 40.0 g of freshly powdered drug (500), a 2000 ml flask, 500 ml of *water R* as the distillation liquid and 0.50 ml of *xylene R* in the graduated tube. Distil at a rate of 3 ml/min to 4 ml/min for 4 h.

Sesquiterpenic acids. Examine by liquid chromatography (2.2.29).

Test solution. Place 1.50 g of the powdered drug (710) in a 100 ml round-bottomed flask with a ground-glass neck. Add 20 ml of *anhydrous methanol R*. Mix and heat on a water-bath under a reflux condenser for 30 min. Allow to cool and filter. Place the filter with the residue in the 100 ml round-bottomed flask. Add 20 ml of *anhydrous methanol R* and heat on a water-bath under the reflux condenser for 15 min. Allow to cool and filter. Combine the filtrates and dilute to 50.0 ml with *anhydrous methanol R* rinsing the round-bottomed flask and the filter.

Reference solution. Prepare the solution immediately before use, protected from bright light. Dissolve 30 mg of *dantrol R* in *anhydrous methanol R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with *anhydrous methanol R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min:
Mobile phase A. Mix 20 volumes of *acetonitrile R* and 80 volumes of a 5 g/l solution of *phosphoric acid R*,

Mobile phase B. Mix 80 volumes of *acetonitrile R* and 20 volumes of a 5 g/l solution of *phosphoric acid R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 5	55	45	isocratic
5 - 18	55 → 20	45 → 80	linear gradient
18 - 20	20	80	isocratic
20 - 22	20 → 55	80 → 45	linear gradient

– as detector a spectrophotometer set at 220 nm,

– a 20 µl loop injector.

Inject the test solution and the reference solution.

When the chromatograms are recorded in the prescribed conditions, the relative retention times (to dantron) are: acetoxyvalerenic acid about 0.7 and valerenic acid about 1.2.

Calculate the percentage content of acetoxyvalerenic acid using the expression:

$$\frac{A_2 \times m_1 \times 11.51}{A_1 \times m_2}$$

Calculate the percentage content of valerenic acid using the expression:

$$\frac{A_3 \times m_1 \times 8.09}{A_1 \times m_2}$$

Or calculate the percentage content of both sesquiterpenic acids using the expression:

$$\frac{\left[\frac{A_2 \times 11.51}{A_1} + \frac{A_3 \times 8.09}{A_1} \right] \times m_1}{m_2}$$

A_1 = area of the peak due to dantron in the chromatogram obtained with the reference solution,

A_2 = area of the peak due to acetoxyvalerenic acid in the chromatogram obtained with the test solution,

A_3 = area of the peak due to valerenic acid in the chromatogram obtained with the test solution,

m_1 = mass of dantron, in grams, used to prepare the reference solution,

m_2 = mass of the drug to be examined, in grams.

STORAGE

Store protected from light.

01/2005:0796

VALINE

Valinum

$C_5H_{11}NO_2$

M_r 117.1

DEFINITION

Valine contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of (S)-2-amino-3-methylbutanoic acid, calculated with reference to the dried substance.

CHARACTERS

White or almost white, crystalline powder or colourless crystals, soluble in water, very slightly soluble in alcohol.

IDENTIFICATION

First identification: A, B.

Second identification: A, C.

A. It complies with the test for specific optical rotation (see Tests).

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *valine CRS*. Examine the substances prepared as discs.

C. Examine the chromatograms obtained in the test for ninhydrin-positive substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 2.5 g in *water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution BY₆ (2.2.2, Method II).

Specific optical rotation (2.2.7). Dissolve 2.00 g in *hydrochloric acid R1* and dilute to 25.0 ml with the same acid. The specific optical rotation is + 26.5 to + 29.0, calculated with reference to the dried substance.

Ninhydrin-positive substances. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). Dissolve 0.10 g of the substance to be examined in *dilute hydrochloric acid R* and dilute to 10 ml with the same acid.

Test solution (b). Dilute 1 ml of test solution (a) to 50 ml with *water R*.

Reference solution (a). Dissolve 10 mg of *valine CRS* in 0.1 M *hydrochloric acid* and dilute to 50 ml with the same acid.

Reference solution (b). Dilute 5 ml of test solution (b) to 20 ml with *water R*.

Reference solution (c). Dissolve 10 mg of *phenylalanine CRS* and 10 mg of *valine CRS* in 0.1 M *hydrochloric acid* and dilute to 25 ml with the same acid.

Apply to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 20 volumes of *water R* and 60 volumes of *butanol R*. Allow the plate to dry in air, spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots.

Chlorides (2.4.4). Dilute 10 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (200 ppm).

Sulphates (2.4.13). Dissolve 0.5 g in *distilled water R* and dilute to 15 ml with the same solvent. The solution complies with the limit test for sulphates (300 ppm).

Ammonium (2.4.1). 50 mg complies with limit test B for ammonium (200 ppm). Prepare the standard using 0.1 ml of *ammonium standard solution (100 ppm NH₄) R*.

Iron (2.4.9). In a separating funnel, dissolve 1.0 g in 10 ml of *dilute hydrochloric acid R*. Shake with three quantities, each of 10 ml, of *methyl isobutyl ketone R1*, shaking for

3 min each time. To the combined organic layers add 10 ml of *water R* and shake for 3 min. The aqueous layer complies with the limit test for iron (10 ppm).

Heavy metals (2.4.8). 2.0 g complies with limit test D for heavy metals (10 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.100 g in 3 ml of *anhydrous formic acid R*. Add 30 ml of *anhydrous acetic acid R*. Using 0.1 ml of *naphtholbenzein solution R* as indicator, titrate with 0.1 M *perchloric acid* until the colour changes from brownish-yellow to green.

1 ml of 0.1 M *perchloric acid* is equivalent to 11.71 mg of $C_8H_{16}O_2$.

STORAGE

Store protected from light.

01/2005:1378

VALPROIC ACID

Acidum valproicum

$C_8H_{16}O_2$

M_r 144.2

DEFINITION

Valproic acid contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-propylpentanoic acid.

CHARACTERS

A colourless or very slightly yellow, clear liquid, slightly viscous, very slightly soluble in water, miscible with alcohol and with methylene chloride. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

A. Refractive index (2.2.5): 1.422 to 1.425.

B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *valproic acid CRS*.

C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution. Dissolve 50 mg of *valproic acid CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 15 cm using a mixture of equal volumes of *ether R* and *methylene chloride R*. Allow the plate to dry in air.

Spray with *bromocresol green solution R*. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with the reference solution.

D. To 1 ml add 3 ml of *dilute sodium hydroxide solution R*. Add 3 ml of *water R* and 1 ml of a 100 g/l solution of *cobalt nitrate R*. A violet precipitate is formed. Filter; the precipitate dissolves in *methylene chloride R*.

TESTS

Appearance of solution. Dissolve 2.0 g in *dilute sodium hydroxide solution R* and dilute to 10 ml with the same alkaline solution. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

Related substances. Examine by gas chromatography (2.2.28), using *butyric acid R* as the internal standard.

Internal standard solution. Dissolve 10 mg of *butyric acid R* in *heptane R* and dilute to 200 ml with the same solvent.

Test solution. Dissolve 0.250 g of the substance to be examined in the internal standard solution and dilute to 5.0 ml with the same solution. Dilute 1.0 ml of the solution to 10.0 ml with *heptane R*.

Reference solution. Dissolve 20 mg of the substance to be examined and 20 mg of 2-(1-methylethyl)pentanoic acid *CRS* in *heptane R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *heptane R*.

The chromatographic procedure may be carried out using:

- a wide-bore fused-silica column 30 m long and 0.53 mm in internal diameter coated with *macrogol 20 000 2-nitrotetraphthalate R* (film thickness 0.5 µm),
 - *helium for chromatography R* as the carrier gas at a flow rate of 8 ml/min,
 - a flame-ionisation detector,
- with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 10	130	–	isothermal
	10 - 30	130 → 190	3	linear gradient
Injection port		220		
Detector		220		

Inject 1 µl of each solution. The test is not valid unless, in the chromatogram obtained with the reference solution, the resolution between the peaks corresponding to 2-(1-methylethyl)pentanoic acid and valproic acid is at least 3.0. In the chromatogram obtained with the test solution: the sum of the areas of the peaks, apart from the principal peak, is not greater than three times the area of the peak due to the internal standard (0.3 per cent); none of the peaks, apart from the principal peak, has an area greater than that of the peak due to the internal standard (0.1 per cent). Disregard any peak with an area less than 0.1 times that of the peak due to the internal standard.

Heavy metals (2.4.8). Dissolve 2.0 g in *alcohol (80 per cent V/V) R* and dilute to 20 ml with the same solvent. 12 ml of the solution complies with limit test B for heavy metals (20 ppm). Prepare the standard using lead standard solution (2 ppm Pb) obtained by diluting *lead standard solution (100 ppm Pb) R* with *alcohol (80 per cent V/V) R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

01/2005:1058
corrected

Dissolve 0.100 g in 25 ml of *alcohol R*. Add 2 ml of *water R*. Titrate with 0.1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M sodium hydroxide is equivalent to 14.42 mg of $C_{86}H_{76}Cl_3N_9O_{24}$.

STORAGE

Store in an airtight container.

IMPURITIES

- A. $R = R' = H$: pentanoic acid (valeric acid),
- B. $R = H, R' = CH_2-CH_3$: (2*RS*)-2-ethylpentanoic acid,
- C. $R = H, R' = CH(CH_3)_2$: (2*RS*)-2-(1-methylethyl)pentanoic acid,
- D. $R = R' = CH_2-CH_2-CH_3$: 2,2-dipropylpentanoic acid,

- E. $R = R' = H$: pentanamide (valeramide),
- F. $R = H, R' = CH_2-CH_2-CH_3$: 2-propylpentanamide,
- G. $R = R' = CH_2-CH_2-CH_3$: 2,2-dipropylpentanamide,

- H. $R = R' = H$: pentanenitrile (valeronitrile),
- I. $R = H, R' = CH_2-CH_2-CH_3$: 2-propylpentanenitrile,
- J. $R = R' = CH_2-CH_2-CH_3$: 2,2-dipropylpentanenitrile.

VANCOMYCIN HYDROCHLORIDE

Vancomycini hydrochloridum

 $C_{66}H_{76}Cl_3N_9O_{24}$ M_r 1486

DEFINITION

Vancomycin hydrochloride is the hydrochloride of a mixture of related glycopeptides, consisting principally of the monohydrochloride of (3*S*,6*R*,7*R*,22*R*,23*S*,26*S*,*aS*,36*R*,38*aR*)-3-(2-amino-2-oxoethyl)-44-[[2-*O*-(3-amino-2,3,6-trideoxy-3-*C*-methyl- α -*L*-xylo-hexopyranosyl)- β -D-glucopyranosyl]oxy]-10,19-dichloro-7,22,28,30,32-pentahydroxy-6-[[2*R*]-4-methyl-2-(methylamino)pentanoyl]amino]-2,5,24,38,39-pentaoxo-2,3,4,5,6,7,23,24,25,26,36,37,38,38*a*-tetradecahydro-22*H*-8,11:18,21-dietheno-23,36-(iminomethano)-13,16:31,35-dimetheno-1*H*,13*H*-[1,6,9]oxadiazacyclohexadecino[4,5-*m*][10,2,16]benzoxadiazacyclotetracosine-26-carboxylic acid (vancomycin B), a substance produced by certain strains of *Amycolatopsis orientalis* or obtained by any other means. The potency is not less than 1050 IU/mg, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white powder, hygroscopic, freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

- A. Examine the chromatograms obtained in the test for vancomycin B. The retention time of the principal peak in the chromatogram obtained with test solution (a) is similar to that of the principal peak in the chromatogram obtained with the reference solution.
- B. It gives reaction (a) of chlorides (2.3.1).

TESTS

Appearance of solution. Dissolve 2.50 g in *water R* and dilute to 25.0 ml with the same solvent. The solution is clear (2.2.1). The absorbance (2.2.25) of the solution measured at 450 nm is not greater than 0.10.

pH (2.2.3). Dissolve 0.50 g in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent. The pH of the solution is 2.5 to 4.5.

Vancomycin B. Not less than 93.0 per cent, determined by liquid chromatography (2.2.29).

Test solution (a). Dissolve 10.0 mg of the substance to be examined in mobile phase A and dilute to 5.0 ml with mobile phase A.

Test solution (b). Dilute 2.0 ml of test solution (a) to 50.0 ml with mobile phase A.

Test solution (c). Dilute 0.5 ml of test solution (b) to 20.0 ml with mobile phase A.

Reference solution. Dissolve the contents of a vial of *vancomycin hydrochloride CRS* in *water R* and dilute with the same solvent to obtain a solution containing 0.5 mg/ml. Heat at 65 °C for 24 h. Allow to cool.

Use the solutions within 4 h of preparation.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phases at a flow rate of 1.0 ml/min the following solutions:

Mobile phase A. To 4 ml of *triethylamine R* add 1996 ml of *water R* and adjust to pH 3.2 with *phosphoric acid R*; to 920 ml of this solution add 10 ml of *tetrahydrofuran R* and 70 ml of *acetonitrile R*,

Mobile phase B. To 4 ml of *triethylamine R* add 1996 ml of *water R* and adjust to pH 3.2 with *phosphoric acid R*; to 700 ml of this solution add 10 ml of *tetrahydrofuran R* and 290 ml of *acetonitrile R*,

- as detector a spectrophotometer set at 280 nm,
- a 20 µl loop injector.

Record the chromatograms under the following conditions. Elute initially with mobile phase A. After 13 min, use gradient elution increasing the concentration of mobile phase B by 11 per cent *V/V* per minute. Finally, elute for 4 min using mobile phase B.

Inject test solution (c). The test is not valid unless the principal peak in the chromatogram obtained has a signal-to-noise ratio of at least five. Inject test solution (b). The test is not valid unless the symmetry factor of the vancomycin peak is at most 1.6. Inject the reference solution. The test is not valid unless the resolution between the two principal peaks is at least 5.0. Inject test solution (a).

Calculate the percentage content of vancomycin B hydrochloride using the expression:

$$\frac{A_b \times 100}{A_b + \left(\frac{A_t}{25}\right)}$$

A_b = area of the peak corresponding to vancomycin B in the chromatogram obtained with test solution (b),

A_t = sum of the areas of the peaks corresponding to impurities in the chromatogram obtained with test solution (a).

Related substances. Examine by liquid chromatography (2.2.29), as described under the test for vancomycin B.

Inject separately test solution (a), test solution (b) and test solution (c). Calculate the percentage content of each impurity using the expression:

$$\frac{\left(\frac{A_i}{25}\right) \times 100}{A_b + \left(\frac{A_t}{25}\right)}$$

A_i = area of an impurity peak in the chromatogram obtained with test solution (a),

A_b = area of the peak corresponding to vancomycin B in the chromatogram obtained with test solution (b),

A_t = sum of the areas of the peaks corresponding to impurities in the chromatogram obtained with test solution (a).

The content of no impurity is greater than 4.0 per cent and the sum of the contents of impurities is not greater than 7.0 per cent. Disregard any peak with an area less than that of the principal peak in the chromatogram obtained with test solution (c).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (30 ppm). Prepare the standard using 3.0 ml of *lead standard solution (10 ppm Pb) R*.

Water (2.5.12). Not more than 5.0 per cent, determined on 0.500 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 1.0 per cent, determined on 1.00 g.

Bacterial endotoxins (2.6.14): less than 0.25 IU/mg, if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Carry out the microbiological assay of antibiotics (2.7.2). Use *vancomycin hydrochloride CRS* as the reference substance.

STORAGE

Store in an airtight container, protected from light. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

- A. R2 = NH₂, R3 = H: *N*-demethylvancomycin B,
 B. R2 = OH, R3 = CH₃: desamidovancomycin B,
 C. R1 = H, R2 = NH₂, R3 = CH₃: aglucovancomycin B,

01/2005:0747

VANILLIN

Vanillinum

C₈H₈O₃*M*_r 152.1

DEFINITION

Vanillin contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 4-hydroxy-3-methoxybenzaldehyde, calculated with reference to the dried substance.

CHARACTERS

White or slightly yellowish, crystalline powder or needles, slightly soluble in water, freely soluble in alcohol and in methanol. It dissolves in dilute solutions of alkali hydroxides.

IDENTIFICATION

First identification: B.

Second identification: A, C, D.

- A. Melting point (2.2.14): 81 °C to 84 °C.
 B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *vanillin CRS*. Examine the substances prepared as discs.
 C. Examine the chromatograms obtained in the test for related substances in daylight after spraying. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
 D. To 5 ml of a saturated solution of the substance to be examined add 0.2 ml of *ferric chloride solution R1*. A blue colour is produced. Heat to 80 °C. The solution becomes brown. On cooling, a white precipitate is formed.

TESTS

Appearance of solution. Dissolve 1.0 g in *alcohol R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution B₆ (2.2.2, *Method II*).

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.1 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 10 mg of *vanillin CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dilute 0.5 ml of test solution (a) to 100 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop in an unsaturated tank over a path of 10 cm using a mixture of 0.5 volumes of *anhydrous acetic acid R*, 1 volume of *methanol R* and 98.5 volumes of *methylene chloride R*. Dry the plate in a current of cold air. Examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent). Spray with *dinitrophenylhydrazine-aceto-hydrochloric solution R* and examine in daylight. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (b) (0.5 per cent).

Reaction with sulphuric acid. Dissolve 50 mg in 5 ml of *sulphuric acid R*. After 5 min, the solution is not more intensely coloured than a mixture of 4.9 ml of yellow primary solution and 0.1 ml of red primary solution or a mixture of 4.9 ml of yellow primary solution and 0.1 ml of blue primary solution (2.2.2, *Method I*).

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in a desiccator for 4 h.

Sulphated ash (2.4.14). Not more than 0.05 per cent, determined on 2.0 g.

ASSAY

Dissolve 0.120 g in 20 ml of *alcohol R* and add 60 ml of *carbon dioxide-free water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 15.21 mg of C₈H₈O₃.

STORAGE

Store protected from light.

01/2005:0573 D. It gives reaction (b) of chlorides (2.3.1).

VERAPAMIL HYDROCHLORIDE**Verapamili hydrochloridum** $C_{27}H_{39}ClN_2O_4$ M_r 491.1**DEFINITION**

Verapamil hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of (2*RS*)-2-(3,4-dimethoxyphenyl)-5-[[2-(3,4-dimethoxyphenyl)ethyl](methyl)amino]-2-(1-methylethyl)pentanenitrile hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white, crystalline powder, soluble in water, freely soluble in methanol, sparingly soluble in alcohol.

It melts at about 144 °C.

IDENTIFICATION

First identification: B, D.

Second identification: A, C, D.

- A. Dissolve 20.0 mg in 0.01 *M* hydrochloric acid and dilute to 100.0 ml with the same acid. Dilute 5.0 ml of this solution to 50.0 ml with 0.01 *M* hydrochloric acid. Examined between 210 nm and 340 nm (2.2.25), the solution shows 2 absorption maxima, at 229 nm and 278 nm, and a shoulder at 282 nm. The ratio of the absorbance at the maximum at 278 nm to that at the maximum at 229 nm is 0.35 to 0.39.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with verapamil hydrochloride CRS. Examine the substances prepared as discs.
- C. Examine by thin-layer chromatography (2.2.27), using as the coating substance a suitable silica gel with a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 10 mg of the substance to be examined in methylene chloride *R* and dilute to 5 ml with the same solvent.

Reference solution (a). Dissolve 20 mg of verapamil hydrochloride CRS in methylene chloride *R* and dilute to 10 ml with the same solvent.

Reference solution (b). Dissolve 5 mg of papaverine hydrochloride CRS in reference solution (a) and dilute to 5 ml with the same solution.

Apply separately to the plate 5 µl of each solution. Develop over a path of 15 cm using a mixture of 15 volumes of diethylamine *R* and 85 volumes of cyclohexane *R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated principal spots.

TESTS

Solution S. Dissolve 1.0 g in carbon dioxide-free water *R* while gently heating and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3). The pH of solution S is 4.5 to 6.0.

Optical rotation (2.2.7). The angle of optical rotation, determined on solution S, is -0.10° to $+0.10^\circ$.

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the initial mobile phase composition and dilute to 10.0 ml with the same mobile phase.

Reference solution (a). Dissolve 5 mg of verapamil hydrochloride CRS, 5 mg of verapamil impurity I CRS and 5 mg of verapamil impurity M CRS in the initial mobile phase composition and dilute to 20 ml with the same mobile phase. Dilute 1 ml of this solution to 10 ml with the initial mobile phase composition.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the initial mobile phase composition. Dilute 1.0 ml of this solution to 10.0 ml with the same mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with end-capped palmitamidopropylsilyl silica gel for chromatography *R* (5 µm),
- as mobile phase at a flow rate of 1.5 ml/min a double isocratic programme using the following conditions:
Mobile phase A. A 6.97 g/l solution of dipotassium hydrogen phosphate *R* adjusted to pH 7.20 with phosphoric acid *R*,
Mobile phase B. Acetonitrile *R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
0 - 22	63	37	first isocratic step
22 - 27	63 → 35	37 → 65	switch to second isocratic step
27 - 35	35	65	second isocratic step
35 - 36	35 → 63	65 → 37	switch to initial mobile phase
36 - 50	63	37	equilibration

- as detector a spectrophotometer set at 278 nm.

Equilibrate the column with the initial mobile phase composition for about 60 min.

Inject 10 µl of reference solution (a). When the chromatogram is recorded in the prescribed conditions the retention times are: verapamil, about 16 min, verapamil impurity I, about 21 min and verapamil impurity M about 32 min, eluting as a doublet. The test is not valid unless the resolution between the peaks corresponding to verapamil and verapamil impurity I is at least 5.0 and verapamil impurity M elutes from the column.

Adjust the sensitivity of the system so that the height of principal peak in the chromatogram obtained with 10 µl of the reference solution (b) is at least 15 per cent of the full scale of the recorder.

Inject separately 10 µl of the test solution and 10 µl of reference solution (b). In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the

principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent); the sum of the areas of the peaks, apart from the principal peak, is not greater than 3 times the area of the principal peak in the chromatogram obtained with reference solution (b) (0.3 per cent). Disregard any peak with an area less than 0.1 times the area of the principal peak in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (10 ppm). Prepare the standard using 1 ml of lead standard solution (10 ppm Pb) R.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.400 g in 50 ml of *ethanol* R and add 5.0 ml of 0.01 M hydrochloric acid. Titrate with 0.1 M sodium hydroxide, determining the end-point potentiometrically (2.2.20). Measure the volume of titrant required between the 2 points of inflexion.

1 ml of 0.1 M sodium hydroxide is equivalent to 49.11 mg of $C_{27}H_{39}ClN_2O_4$.

STORAGE

Store protected from light.

01/2005:0748 ASSAY

corrected

Examine by liquid chromatography (2.2.29).

*Keep the solutions in iced water before use.**Test solution.* Dilute 1.0 ml of solution S (see Tests) to 5.0 ml with *water R*.*Reference solution (a).* Dissolve the contents of a vial of *vinblastine sulphate CRS* in 5.0 ml of *water R* to obtain a concentration of 1.0 mg/ml.*Reference solution (b).* Dissolve 1.0 mg of *vincristine sulphate CRS* in 1.0 ml of reference solution (a).*Reference solution (c).* Dilute 1.0 ml of reference solution (a) to 50.0 ml with *water R*.*Reference solution (d).* Dilute 1.0 ml of reference solution (c) to 20.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octylsilyl silica gel for chromatography R* (5 µm). Place between the injector and the column a guard column packed with suitable silica gel,
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 38 volumes of a 1.5 per cent V/V solution of *diethylamine R* adjusted to pH 7.5 with *phosphoric acid R*, 12 volumes of *acetonitrile R* and 50 volumes of *methanol R*,
- as detector a spectrophotometer set at 262 nm,
- a loop injector.

Inject 10 µl of each solution and record the chromatograms for three times the retention time of the peak corresponding to vinblastine. The assay is not valid unless: in the chromatogram obtained with reference solution (b) the resolution between the peaks corresponding to vincristine and vinblastine is not less than four; the peak in the chromatogram obtained with reference solution (d) has a signal-to-noise ratio not less than five. Calculate the percentage content of $C_{46}H_{60}N_4O_{13}S$ from the area of the principal peak in each of the chromatograms obtained with the test solution and reference solution (a) and from the declared content of *vinblastine sulphate CRS*.

STORAGE

Store in an airtight, glass container, protected from light, at a temperature not exceeding –20 °C. If the substance is sterile, store in an sterile, airtight, tamper-proof glass container.

VINCRIStINE SULPHATE**Vincristini sulfas** $C_{46}H_{58}N_4O_{14}S$ M_r 923**VINBLASTINE SULPHATE****Vinblastini sulfas** $C_{46}H_{60}N_4O_{13}S$ M_r 909**DEFINITION**

Vinblastine sulphate contains not less than 95.0 per cent and not more than the equivalent of 104.0 per cent of methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(5*S*,7*R*,9*S*)-5-ethyl-5-hydroxy-9-(methoxycarbonyl)-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[5,4-*b*]indol-9-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or slightly yellowish, crystalline powder, very hygroscopic, freely soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of vinblastine sulphate*.
- Examine the chromatograms obtained in the assay. The principal peak in the chromatogram obtained with the test solution is similar in position and approximate size to the principal peak in the chromatogram obtained with reference solution (a).

TESTS

Solution S. Dissolve 50.0 mg in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_7 (2.2.2, *Method I*).

pH (2.2.3). Dilute 3 ml of solution S to 10 ml with *carbon dioxide-free water R*. The pH of this solution is 3.5 to 5.0.

Related substances. Examine the chromatograms obtained in the assay. In the chromatogram obtained with the test solution, the area of any peak apart from the principal peak is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent) and the sum of the areas of any such peaks is not greater than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent). Disregard any peak with an area less than that of the peak in the chromatogram obtained with reference solution (d).

Loss on drying. Not more than 15.0 per cent, determined on 3 mg by thermogravimetry (2.2.34). Heat to 200 °C at a rate of 5 °C/min, under a stream of *nitrogen for chromatography R*, at a flow rate of 40 ml/min.

DEFINITION

Methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(5*S*,7*R*,9*S*)-5-ethyl-5-hydroxy-9-(methoxycarbonyl)-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[5,4-*b*]indol-9-yl]-6-formyl-5-hydroxy-8-methoxy-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate sulphate.

Content: 95.0 per cent to 104.0 per cent (dried substance).

CHARACTERS

Appearance: white or slightly yellowish, crystalline powder, very hygroscopic.

Solubility: freely soluble in water, slightly soluble in alcohol.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of vincristine sulphate*.

TESTS

Solution S. Dissolve 50.0 mg in *carbon dioxide-free water R* and dilute to 10.0 ml with the same solvent. *Keep the solution in iced water to carry out the test for related substances.*

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method I*).

pH (2.2.3): 3.5 to 4.5.

Dilute 2 ml of solution S to 10 ml with *carbon dioxide-free water R*.

Related substances. Liquid chromatography (2.2.29). *Keep the solutions in iced water before use.*

Test solution. Dilute 1.0 ml of solution S to 5.0 ml with *water R*.

Reference solution (a). Dissolve the contents of a vial of *vincristine sulphate CRS* in 5.0 ml of *water R* to obtain a concentration of 1.0 mg/ml.

Reference solution (b). Dissolve 1.0 mg of *vinblastine sulphate CRS* in 1.0 ml of reference solution (a).

Reference solution (c). Dilute 1.0 ml of the test solution to 50.0 ml with *water R*.

Reference solution (d). Dilute 1.0 ml of reference solution (c) to 20.0 ml with *water R*.

Precolumn:

- *stationary phase*: octylsilyl silica gel for chromatography *R*.

Column:

- *size*: *l* = 0.25 m, Ø = 4.6 mm,
- *stationary phase*: octylsilyl silica gel for chromatography *R* (5 µm).

Mobile phase:

- *mobile phase A*: 1.5 per cent V/V solution of *diethylamine R* adjusted to pH 7.5 with *phosphoric acid R*,
- *mobile phase B*: *methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 12	38	62
12 - 27	38 → 8	62 → 92
27 - 29	8 → 38	92 → 62
29 - 34	38	62

Flow rate: 2 ml/min.

Detection: spectrophotometer at 297 nm.

Injection: 20 µl.

System suitability: reference solution (b):

- *resolution*: minimum 4 between the peaks due to vincristine and vinblastine.

Limits:

- *any impurity*: not more than the area of the principal peak in the chromatogram obtained with reference solution (c) (2.0 per cent),
- *total*: not more than 2.5 times the area of the principal peak in the chromatogram obtained with reference solution (c) (5.0 per cent),
- *disregard limit*: area of the peak in the chromatogram obtained with reference solution (d) (0.1 per cent).

Loss on drying: maximum 12.0 per cent, determined on 3 mg by thermogravimetry (2.2.34). Heat the substance to be examined to 200 °C increasing the temperature by 5 °C/min, under a current of *nitrogen for chromatography R*, at a flow rate of 40 ml/min.

ASSAY

Liquid chromatography (2.2.29) as described in the test for related substances, with the following modifications.

Mobile phase: mix 30 volumes of a 1.5 per cent V/V solution of *diethylamine R* adjusted to pH 7.5 with *phosphoric acid R* and 70 volumes of *methanol R*.

Flow rate: 1.0 ml/min.

Calculate the percentage content of C₄₆H₅₈N₄O₁₄S using the chromatogram obtained with reference solution (a) and the declared content of *vincristine sulphate CRS*.

STORAGE

In an airtight, glass container, protected from light, at a temperature not exceeding –20 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof glass container.

IMPURITIES

Specified impurities: A, B, C, D, H.

VINDESINE SULPHATE

Vindesini sulfas

C₄₃H₅₇N₅O₁₁SM_r 852

DEFINITION

Vindesine sulphate contains not less than 96.0 per cent and not more than the equivalent of 103.0 per cent of methyl (5*S*,7*R*,9*S*)-9-[(3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-5-carbamoyl-3a-ethyl-4,5-dihydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazol-9-yl]-5-ethyl-5-hydroxy-1,4,5,6,7,8,9,10-octahydro-2*H*-3,7-methanoazacycloundecino[4,5-*b*]indole-9-carboxylate sulphate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, amorphous substance, hygroscopic, freely soluble in water and in methanol, practically insoluble in cyclohexane.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24), comparing with the *Ph. Eur. reference spectrum of vindesine sulphate*.

TESTS

Solution S. Dissolve 50 mg in *carbon dioxide-free water R* and dilute to 10 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y₇ (2.2.2, *Method I*).

pH (2.2.3). The pH of solution S is 3.5 to 5.5.

Related substances. Examine by liquid chromatography (2.2.29). *Keep the solutions in iced water before use.*

Test solution. Dissolve 10.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 50.0 ml with *water R*.

Reference solution (b). Dissolve 1.0 mg of *desacetylvinblastine CRS* in *water R*, add 1.0 ml of the test solution and dilute to 50.0 ml with *water R*.

Reference solution (c). Dilute 1.0 ml of reference solution (a) to 200.0 ml with *water R*.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 2 ml/min:
Mobile phase A. A 1.5 per cent V/V solution of *diethylamine R* adjusted to pH 7.4 with *phosphoric acid R*,
Mobile phase B. *Methanol R*,

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)	Comment
	49	51	equilibration
0 - 40	49	51	isocratic
40 - 49	49 → 30	51 → 70	linear gradient
49 - end	30	70	isocratic

— as detector a spectrophotometer set at 270 nm.

Inject separately 200 µl of the test solution, 200 µl of reference solution (a), 200 µl of reference solution (b) and 200 µl of reference solution (c). Maintain the final concentration of the mobile phase until the total run time is twice the retention time of the principal peak in the chromatogram obtained with the test solution. The test is not valid unless: in the chromatogram obtained with reference solution (b) the retention time of vindesine is less than 40 min; the symmetry factor of the vindesine peak is not more than 2.0; and the resolution of the vindesine and desacetylvinblastine peaks is at least 2.0. In the chromatogram obtained with the test solution: the area of any peak apart from the principal peak is not greater than half of the area of the principal peak in the chromatogram obtained with reference solution (a) (1 per cent); and the sum of the areas of any such peaks is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (2 per cent). Disregard any peak with an area less than the area of the principal peak in the chromatogram obtained with reference solution (c).

Acetonitrile. Not more than 1.5 per cent *m/m* of acetonitrile, determined by gas chromatography (2.2.28).

Internal standard solution (a). Dilute 0.500 g of *propanol R* to 100 ml with *water R*.

Internal standard solution (b). Dilute 10.0 ml of internal standard solution (a) to 50.0 ml with *water R*.

Reference solution. Dilute 10.0 g of *acetonitrile R* to 1000 ml with *water R*. To 3.0 ml of this solution add 10.0 ml of internal standard solution (a) and dilute to 50.0 ml with *water R*.

Test solution. Dissolve 40 mg of the substance to be examined in 1.0 ml of internal standard solution (b).

The chromatographic procedure may be carried out using:

- a glass column 1.25 m long and 3 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 60 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 170 °C and that of the injection port and of the detector at 250 °C.

Inject 3 µl of the reference solution. The test is not valid unless the resolution between acetonitrile and propanol is greater than 1.5 and the symmetry factor for the acetonitrile peak is not greater than 1.6.

Inject 3 µl of the reference solution and 3 µl of the test solution.

Loss on drying. Not more than 10.0 per cent, determined on 9.00 mg by thermogravimetry (2.2.34). Heat to 200 °C at a rate of 5 °C/min, under a current of *nitrogen for chromatography R* at a flow rate of 40 ml/min.

ASSAY

Examine by liquid chromatography (2.2.29). *Keep the solutions in iced water before use.*

Test solution. Dissolve 5.0 mg of the substance to be examined in *water R* and dilute to 10.0 ml with the same solvent.

Reference solution (a). Dissolve and dilute the entire contents of a vial of *vindesine sulphate CRS* with *water R* to yield a concentration of approximately 0.50 mg/ml.

Reference solution (b). Add 1.0 mg of *desacetylvinblastine CRS* to 2.0 ml of reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 38 volumes of a 1.5 per cent *V/V* solution of *diethylamine R*, previously adjusted to pH 7.4 with *phosphoric acid R*, and 62 volumes of *methanol R*,
- as detector a spectrophotometer set at 270 nm.

Inject 20 µl of reference solution (b) five times. The test is not valid unless: the resolution between the peaks corresponding to vindesine sulphate and desacetylvinblastine sulphate is greater than 1.5; the symmetry factor of the vindesine peak is not more than 2.0; and the coefficient of variation of the area of the vindesine peak, calculated on the five injections is not greater than 1.5 per cent.

Inject separately 20 µl of the test solution and 20 µl of reference solution (a).

Calculate the content of vindesine sulphate ($C_{43}H_{57}N_5O_{11}S$) using the stated content of *vindesine sulphate CRS*.

STORAGE

Store in an airtight polypropylene container with a polypropylene cap, at a temperature not exceeding –50 °C. If the substance is sterile, store in a sterile, airtight, tamper-proof container.

IMPURITIES

A. vindesine 3'-N-oxide,

B. vinblastine,

C. desacetylvinblastine hydrazide.

01/2005:2107

VINORELBINE TARTRATE

Vinorelbini tartras

 $C_{53}H_{66}N_4O_{20}$ M_r 1079

DEFINITION

Methyl (3a*R*,4*R*,5*S*,5a*R*,10b*R*,13a*R*)-4-(acetyloxy)-3a-ethyl-9-[(6*R*,8*S*)-4-ethyl-8-(methoxycarbonyl)-1,3,6,7,8,9-hexahydro-2,6-methano-2*H*-azacyclodecino[4,3-*b*]indol-8-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1*H*-indolizino[8,1-*cd*]carbazole-5-carboxylate dihydrogen bis[(2*R*,3*R*)-2,3-dihydroxybutanedioate].

Content: 98.0 per cent to 102.0 per cent (anhydrous substance).

CHARACTERS

Appearance: white or almost white powder, hygroscopic.

Solubility: freely soluble in water and in methanol, practically insoluble in hexane.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: dissolve 10 mg in 5 ml of *water R*. Add 0.5 ml of *sodium hydroxide solution R*. Extract with 5 ml of *methylene chloride R*. Dry the organic layer over *anhydrous sodium sulphate R*, filter and reduce its volume to about 0.5 ml by evaporation and apply to a disc of *potassium bromide R*. Evaporate and record the spectrum.

Comparison: *vinorelbine tartrate CRS*, treated as described above.

B. It gives reaction (b) of tartrates (2.3.1).

TESTS

Solution S. Dissolve a quantity equivalent to 140.0 mg of the anhydrous substance in *water R* and dilute to 10.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and its absorbance (2.2.25) at 420 nm is maximum 0.030.

pH (2.2.3): 3.3 to 3.8 for solution S.

Related substances. Liquid chromatography (2.2.29): use the normalisation procedure.

Test solution. Dissolve 35.0 mg of the substance to be examined in the mobile phase and dilute to 25 ml with the mobile phase.

Reference solution (a). Dissolve 7 mg of *vinorelbine impurity B CRS* in *water R* and dilute to 50 ml with the same solvent. To 1 ml of this solution add 14 mg of *vinorelbine tartrate CRS*, dissolve in *water R* and dilute to 10 ml with the same solvent. Expose this solution for 1 h to a xenon

lamp apparatus at a wavelength of 310-880 nm, supplying a dose of 1600 kJ/m² at a fluence rate of 500 W/m² in order to generate impurity A.

Reference solution (b). Dilute 1.0 ml of the test solution to 20.0 ml with *water R*. Dilute 1.0 ml of this solution to 100.0 ml with the mobile phase.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 3.9$ mm,
- **stationary phase:** spherical *end-capped octadecylsilyl silica gel for chromatography R* (5 μ m) with a specific surface area of 125 m²/g, a pore size of 30 nm and a carbon loading of 7 per cent,
- **temperature:** 35 ± 5 °C.

Mobile phase: dissolve 1.22 g of *sodium decanesulphonate R* in 620 ml of *methanol R* and add 380 ml of a 7.80 g/l solution of *sodium dihydrogen phosphate R* previously adjusted to pH 4.2 with *dilute phosphoric acid R*.

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 267 nm.

Injection: 20 μ l.

Run time: twice the retention time of vinorelbine.

Relative retention with reference to vinorelbine (retention time = about 14 min): impurity A = about 0.8; impurity B = about 1.2.

System suitability:

- **peak-to-valley ratio:** minimum 4, where H_p = height above the baseline of the peak due to impurity B and H_v = height above the baseline of the lowest point of the curve separating this peak from the peak due to vinorelbine in the chromatogram obtained with reference solution (a),
- **signal-to-noise ratio:** minimum 10 for the principal peak in the chromatogram obtained with reference solution (b).

Limits:

- **impurity A:** maximum 0.3 per cent,
- **any other impurity:** for each impurity, maximum 0.2 per cent,
- **total of impurities other than A:** maximum 0.7 per cent,
- **disregard limit:** the area of the principal peak in the chromatogram obtained with reference solution (b).

Boron: maximum 50 ppm.

Test solution. Dissolve 0.10 g of the substance to be examined in 2 ml of *water R*. Slowly add 10.0 ml of *sulphuric acid R* while cooling in iced water. Stir and allow to warm to room temperature. Add 10.0 ml of a 0.5 g/l solution of *carminic acid R* in *sulphuric acid R*.

Reference solution. Dilute 2.5 ml of a 0.572 g/l solution of *boric acid R* to 100.0 ml with *water R*. To 2.0 ml of this solution slowly add 10.0 ml of *sulphuric acid R* while cooling in iced water. Stir and allow to warm to room temperature. Add 10.0 ml of a 0.5 g/l solution of *carminic acid R* in *sulphuric acid R*.

Blank solution. To 2.0 ml of *water R* slowly add 10.0 ml of *sulphuric acid R* while cooling in iced water. Stir and allow to warm to room temperature. Add 10.0 ml of a 0.5 g/l solution of *carminic acid R* in *sulphuric acid R*.

After 45 min, measure the absorbance (2.2.25) of the test solution and the reference solution, between 560 nm and 650 nm, using the blank solution as compensation liquid. The maximum absorbance value of the test solution is not greater than that of the reference solution.

Fluorides: maximum 50 ppm.

Potentiometry (2.2.36, *Method I*) using a fluoride-selective indicator electrode and a silver-silver chloride reference electrode.

Test solution. Dissolve 0.19 g of the substance to be examined in 20 ml of *water R*. Add 5.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50 ml with *water R*.

Reference solutions. To 0.6 ml, 0.8 ml, 1.0 ml, 1.2 ml and 1.4 ml of *fluoride standard solution (10 ppm F) R*, add 5.0 ml of *total-ionic-strength-adjustment buffer R* and dilute to 50 ml with *water R*.

Introduce the electrodes into the reference solutions and allow to stand for 5 min. Determine the potential difference between the electrodes after 1 min of stabilisation. Using semi-logarithmic paper plot the potential difference obtained for each reference solution as a function of concentration of fluoride. Using exactly the same conditions, determine the potential difference obtained with the test solution and calculate the content of fluoride.

Silver: maximum 5 ppm.

Atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 0.500 g of the substance to be examined in 10.0 ml of *water R*.

Reference solutions. Prepare the reference solutions using *silver standard solution (5 ppm Ag) R* and diluting with a 6.5 per cent *V/V* solution of *lead-free nitric acid R*.

Source: silver hollow-cathode lamp.

Wavelength: 328.1 nm.

Atomisation device: air-acetylene flame.

Water (2.5.12): maximum 4.0 per cent, determined on 0.250 g.

Bacterial endotoxins (2.6.14): less than 2 IU/mg (expressed as vinorelbine base), if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins.

ASSAY

Dissolve 0.350 g in 40 ml of *glacial acetic acid R*. Titrate with 0.1 *M* *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M* *perchloric acid* is equivalent to 53.96 mg of $C_{53}H_{66}N_4O_{20}$.

STORAGE

Under an inert gas, protected from light, at a temperature not exceeding -15°C .

LABELLING

The label states, where applicable, that the substance is free from bacterial endotoxins.

IMPURITIES

Specified impurities: A.

Other detectable impurities: B, C, D, E, F, G, H, I, J.

A. methyl (3aS,4R,5aR,10bR,13aR)-4-(acetyloxy)-3,5-epoxy-3a-ethyl-9-[(6R,8S)-4-ethyl-8-(methoxycarbonyl)-1,3,6,7,8,9-hexahydro-2,6-methano-2H-azacyclodecino[4,3-b]indol-8-yl]-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-3H-indolizino[8,1-cd]carbazole-5-carboxylate,

B. R1 = R3 = H, R2 = CH₃: methyl (3aR,4R,5S,5aR,10bR,13aR)-3a-ethyl-9-[(6R,8S)-4-ethyl-8-(methoxycarbonyl)-1,3,6,7,8,9-hexahydro-2,6-methano-2H-azacyclodecino[4,3-b]indol-8-yl]-4,5-dihydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1H-indolizino[8,1-cd]carbazole-5-carboxylate,

H. R1 = R2 = H, R3 = CO-CH₃: (3aR,4R,5S,5aR,10bR,13aR)-4-(acetyloxy)-3a-ethyl-9-[(6R,8S)-4-ethyl-8-(methoxycarbonyl)-1,3,6,7,8,9-hexahydro-2,6-methano-2H-azacyclodecino[4,3-b]indol-8-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1H-indolizino[8,1-cd]carbazole-5-carboxylic acid,

I. F. (2RS,6R,8S)-8-[(3aR,4R,5S,5aR,10bR,13aR)-4-(acetyloxy)-3a-ethyl-5-hydroxy-8-methoxy-5-(methoxycarbonyl)-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1H-indolizino[8,1-cd]carbazol-9-yl]-4-ethyl-8-(methoxycarbonyl)-2-methyl-1,3,6,7,8,9-hexahydro-2,6-methano-2H-azacyclodecino[4,3-b]indolium,

J. methyl (3aR,4R,5S,5aR,10bR,13aR)-4-(acetyloxy)-3a-ethyl-9-[(7R,9S)-5-ethyl-9-(methoxycarbonyl)-1,4,7,8,9,10-hexahydro-2H-3,7-methanoazacycloundecino[5,4-b]indol-9-yl]-5-hydroxy-8-methoxy-6-methyl-3a,4,5,5a,6,11,12,13a-octahydro-1H-indolizino[8,1-cd]carbazole-5-carboxylate.

01/2005:0034

VISCOSE WADDING, ABSORBENT

Lanugo cellulosi absorbens

DEFINITION

Absorbent viscose wadding consists of bleached, carefully carded, new fibres of regenerated cellulose obtained by the viscose process, with or without the addition of titanium

dioxide, of linear density 1.0 dtex to 8.9 dtex (dtex = mass of 10 000 m of fibre, expressed in grams) and cut to a suitable staple length. It does not contain any compensatory colouring matter.

CHARACTERS

It is white or very slightly yellow, has a lustrous or matt appearance, and is soft to the touch.

IDENTIFICATION

A. Viscose rayon fibres may be solid or hollow; hollow fibres may have a continuous lumen or be compartmented. The fibres have an average length of 25 mm to 80 mm and when examined under a microscope in the dry state, or when mounted in *alcohol R* and *water R*, the following characters are observed. They are usually of a more or less uniform width, with many longitudinal parallel lines distributed unequally over the width. The ends are cut more or less straight. Matt fibres contain numerous granular particles of approximately 1 µm average diameter.

Solid fibres. In longitudinal view, the surface of the fibres may be uneven or crenate. Fibres having an approximately circular or elliptical cross section have a diameter of about 10 µm to 20 µm and those that are flattened and twisted ribbons vary in width from 15 µm to 20 µm as the twisting of the filament reveals first the major axis and then the minor axis. They are about 4 µm in thickness. Other solid cross sections are Y-shaped and have protruding limbs with the major axis 5 µm to 25 µm in length and the minor axis 2 µm to 8 µm wide.

Hollow fibres. Fibres with a continuous, hollow lumen have a diameter of up to about 30 µm; they are thin-walled, with a wall thickness of about 5 µm. When mounted in *alcohol R* and *water R*, the lumen is clearly indicated in many fibres by the presence of many entrapped air bubbles.

Compartmented fibres. These fibres may have a diameter of up to 80 µm; they are hollow, having a central lumen which is divided up into several compartments. Individual compartments vary in size but typically may be up to about 60 µm in length and there may be more than one compartment across the width of each fibre. Some compartments show entrapped air bubbles when the fibres are mounted in *alcohol R* and *water R*.

- B. When treated with *iodinated zinc chloride solution R*, the fibres become violet.
- C. To 0.1 g add 10 ml of *zinc chloride-formic acid solution R*. Heat to 40 °C and allow to stand for 2 h 30 min, shaking occasionally. It dissolves completely except for the matt variety where titanium dioxide particles remain.
- D. Dissolve the residue obtained in the test for sulphated ash by warming gently with 5 ml of *sulphuric acid R*. Allow to cool and add 0.2 ml of *dilute hydrogen peroxide solution R*. The solution obtained from the lustrous variety undergoes no change in colour; that from the matt variety shows an orange-yellow colour, the intensity of which depends on the quantity of titanium dioxide present.

TESTS

Solution S. Place 15.0 g in a suitable vessel, add 150 ml of *water R*, close the vessel and allow to macerate for 2 h. Decant the solution, squeeze the residual liquid carefully from the sample with a glass rod and mix. Reserve 10 ml of the solution for the test for surface-active substances and filter the remainder.

Acidity or alkalinity. To 25 ml of solution S add 0.1 ml of *phenolphthalein solution R* and to another 25 ml add 0.05 ml of *methyl orange solution R*. Neither solution is pink.

Foreign fibres. Examined under a microscope, it is seen to consist exclusively of viscose fibres, except that occasionally a few isolated foreign fibres may be present.

Fluorescence. Examine a layer about 5 mm in thickness under ultraviolet light at 365 nm. It displays only a slight brownish-violet fluorescence. It shows no intense blue fluorescence, apart from that which may be shown by a few isolated fibres.

Absorbency

Apparatus. A dry cylindrical copper-wire basket 8.0 cm high and 5.0 cm in diameter. The wire of which the basket is constructed is about 0.4 mm in diameter, the mesh is 1.5 cm to 2.0 cm wide and the mass of the basket is 2.7 ± 0.3 g.

Sinking time. Not more than 10 s. Weigh the basket to the nearest centigram (m_1). Take a total of 5.00 g in approximately equal quantities from 5 different places in the product to be examined, place loosely in the basket and weigh the filled basket to the nearest centigram (m_2). Fill a beaker 11 cm to 12 cm in diameter to a depth of 10 cm with water at about 20 °C. Hold the basket horizontally and drop it from a height of about 10 mm into the water. Measure with a stopwatch the time taken for the basket to sink below the surface of the water. Calculate the result as the average of 3 tests.

Water-holding capacity. Not less than 18.0 g of water per gram. After the sinking time has been measured, remove the basket from the water, allow it to drain for exactly 30 s suspended in a horizontal position over the beaker, transfer it to a tared beaker (m_3) and weigh to the nearest centigram (m_4). Calculate the water-holding capacity per gram of absorbent viscose wadding using the following expression:

$$\frac{m_4 - (m_2 + m_3)}{m_2 - m_1}$$

Calculate the result as the average of 3 tests.

Ether-soluble substances. Not more than 0.30 per cent. In an extraction apparatus, extract 5.00 g with *ether R* for 4 h at a rate of at least 4 extractions per hour. Evaporate the ether extract and dry the residue to constant mass at 100 °C to 105 °C.

Extractable colouring matter. In a narrow percolator, slowly extract 10.0 g with *alcohol R* until 50 ml of extract is obtained. The liquid obtained is not more intensely coloured (2.2.2, *Method II*) than reference solution Y₅, GY₆ or a reference solution prepared as follows: to 3.0 ml of blue primary solution add 7.0 ml of hydrochloric acid (10 g/l HCl) and dilute 0.5 ml of this solution to 10.0 ml with hydrochloric acid (10 g/l HCl).

Surface-active substances. Introduce the 10 ml portion of solution S reserved before filtration into a 25 ml graduated ground-glass-stoppered cylinder with an external diameter of 20 mm and a wall thickness of not greater than 1.5 mm, previously rinsed 3 times with *sulphuric acid R* and then with *water R*. Shake vigorously 30 times in 10 s, allow to stand for 1 min and repeat the shaking. After 5 min, any foam present does not cover the entire surface of the liquid.

Water-soluble substances. Not more than 0.70 per cent. Boil 5.00 g in 500 ml of *water R* for 30 min, stirring frequently. Replace the water lost by evaporation. Decant the liquid, squeeze the residual liquid carefully from the sample with a glass rod and mix. Filter the liquid whilst hot. Evaporate

400 ml of the filtrate (corresponding to 4/5 of the mass of the sample taken) and dry the residue to constant mass at 100 °C to 105 °C.

Hydrogen sulphide. To 10 ml of solution S add 1.9 ml of *water R*, 0.15 ml of *dilute acetic acid R* and 1 ml of *lead acetate solution R*. After 2 min, the solution is not more intensely coloured than a reference solution prepared at the same time using 0.15 ml of *dilute acetic acid R*, 1.2 ml of *thioacetamide reagent R*, 1.7 ml of *lead standard solution (10 ppm Pb) R* and 10 ml of solution S.

Loss on drying (2.2.32). Not more than 13.0 per cent, determined on 5.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.45 per cent for the lustrous variety and not more than 1.7 per cent for the matt variety. Introduce 5.00 g into a previously heated and cooled, tared crucible. Heat cautiously over a naked flame and then carefully to dull redness at 600 °C. Allow to cool, add a few drops of *dilute sulphuric acid R*, then heat and incinerate until all the black particles have disappeared. Allow to cool. Add a few drops of *ammonium carbonate solution R*. Evaporate and incinerate carefully, allow to cool and weigh again. Repeat the incineration for periods of 5 min to constant mass.

STORAGE

Store in a dust-proof package in a dry place.

01/2005:0217

VITAMIN A

Vitaminum A

Substance	R	Molecular formula	M_r
all-(E)-retinol	R = H	C ₂₀ H ₃₀ O	286.5
all-(E)-retinol acetate	CO-CH ₃	C ₂₂ H ₃₂ O ₂	328.5
all-(E)-retinol propionate	CO-C ₂ H ₅	C ₂₃ H ₃₄ O ₂	342.5
all-(E)-retinol palmitate	CO-C ₁₅ H ₃₁	C ₃₆ H ₆₀ O ₂	524.9

DEFINITION

Vitamin A refers to a number of substances of very similar structure (including (Z)-isomers) found in animal tissues and possessing similar activity. The principal and biologically most active substance is all-(E)-retinol (all-(E)-3,7-dimethyl-9-(2,6,6-trimethylcyclohex-1-enyl)nona-2,4,6,8-tetraen-1-ol; C₂₀H₃₀O). Vitamin A is generally used in the form of esters such as the acetate, propionate and palmitate.

Synthetic retinol ester refers to an ester of synthetic retinol (acetate, propionate or palmitate) or a mixture of synthetic retinol esters.

The activity of vitamin A is expressed in retinol equivalents (R.E.). 1 mg R.E. corresponds to the activity of 1 mg of all-(E)-retinol. The activity of the other retinol esters is calculated using the stoichiometry, so that 1 mg R.E. of vitamin A corresponds to the activity of:

- 1.147 mg of all-(E)-retinol acetate,
- 1.195 mg of all-(E)-retinol propionate,
- 1.832 mg of all-(E)-retinol palmitate.

International units (IU) are also used. 1 IU of vitamin A is equivalent to the activity of 0.300 µg of all-(*E*)-retinol. The activity of the other retinol esters is calculated using the stoichiometry, so that 1 IU of vitamin A is equivalent to the activity of:

- 0.344 µg of all-(*E*)-retinol acetate,
 - 0.359 µg of all-(*E*)-retinol propionate,
 - 0.550 µg of all-(*E*)-retinol palmitate,
- 1 mg of retinol equivalent is equivalent to 3333 IU.

CHARACTERS

Retinol acetate occurs as pale-yellow crystals (melting point about 60 °C). Once melted retinol acetate tends to yield a supercooled melt.

Retinol propionate occurs as a reddish-brown oily liquid.

Retinol palmitate is a fat-like, light yellow solid or a yellow oily liquid, if melted (melting point about 26 °C).

All retinol esters are practically insoluble in water, soluble or partly soluble in ethanol and miscible with organic solvents. Vitamin A and its esters are very sensitive to the action of air, oxidising agents, acids, light and heat.

Carry out the assay and all tests as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and heat; use freshly prepared solutions.

IDENTIFICATION

A. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Prepare a solution containing about 3.3 IU of vitamin A per microlitre in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Apply to the plate 3 µl of each solution. Develop immediately over 2/3 of the plate using a mixture of 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The identification is not valid unless the chromatogram obtained with the reference solution shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate. The composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

B. It complies with the test for related substances.

TESTS

Retinol. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Prepare a solution in *cyclohexane R*, stabilised with a 1 g/l solution of *butylhydroxytoluene R*, containing about 330 IU of vitamin A per microlitre.

Reference solution. Shake 1 ml of the test solution with 20 ml of 0.1 M *tetrabutylammonium hydroxide* in 2-propanol for 2 min and dilute to 100 ml with *cyclohexane R*, stabilised with a 1 g/l solution of *butylhydroxytoluene R*.

Apply to the plate 3 µl of each solution. Develop immediately over a path of 15 cm using a mixture of 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the reference solution

no or only traces of the retinol ester are seen. Any spot corresponding to retinol in the chromatogram obtained with the test solution is not more intense than the spot in the chromatogram obtained with the reference solution (1.0 per cent).

Related substances. Examine by ultraviolet absorption spectrophotometry (2.2.25). Determine the absorption maximum of the solution for “Activity”. The solution shows an absorption maximum at 325 nm to 327 nm. Measure the absorbances at 300 nm, 350 nm and 370 nm and calculate the ratio A_{λ}/A_{326} for each wavelength. None of the ratios A_{λ}/A_{326} exceed 0.593 at 300 nm, 0.537 at 350 nm, 0.142 at 370 nm.

ACTIVITY

The activity of the substance is determined in order to be taken into account for the production of concentrates.

Examine by ultraviolet absorption spectrophotometry (2.2.25). Dissolve 25 mg to 100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with 2-propanol *R1* to a presumed concentration of 10 IU/ml to 15 IU/ml. This solution is also used for the test for related substances.

Determine the absorbance of the maximum at 326 nm. Calculate the activity of vitamin A in International Units per gram from the expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the substance to be examined, in grams,

V = total volume to which the substance to be examined is diluted to give 10 IU/ml to 15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

STORAGE

Store in an airtight, well-filled container, protected from light.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units per gram,
- the name of the ester or esters.

IMPURITIES

A. R = H, CO-CH₃: kitols (Diels-Alder dimers of vitamin A),

- B. (3*E*,5*E*,7*E*)-3,7-dimethyl-9-[(1*Z*)-2,6,6-trimethylcyclohex-2-enylidene]nona-1,3,5,7-tetraene (anhydro-vitamin A),

- C. (3*E*,5*E*,7*E*)-3,7-dimethyl-9-[(1*Z*)-2,6,6-trimethylcyclohex-2-enylidene]nona-3,5,7-trien-1-ol (*retro*-vitamin A),
D. oxidation products of vitamin A.

01/2005:0219

VITAMIN A CONCENTRATE (OILY FORM), SYNTHETIC

Vitaminum A densatum oleosum

DEFINITION

Synthetic vitamin A concentrate (oily form) is prepared from synthetic retinol ester (0217) as is or by dilution with a suitable vegetable fatty oil. The concentrate may contain suitable stabilisers such as antioxidants.

The declared content of vitamin A is not less than 500 000 IU/g and the concentrate contains not less than 95.0 per cent and not more than 110.0 per cent of the content stated on the label.

CHARACTERS

A yellow or brownish-yellow, oily liquid, practically insoluble in water, soluble or partly soluble in ethanol, miscible with organic solvents. Partial crystallisation may occur in highly concentrated solutions.

IDENTIFICATION

Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄* plate R.

Test solution. Prepare a solution containing about 3.3 IU of vitamin A per microlitre in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *cyclohexane R* containing 1 g/l of *butylhydroxytoluene R*.

Apply to the plate 3 µl of each solution. Develop immediately over a path of 15 cm using a mixture of 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The identification is not valid unless the chromatogram obtained with the reference solution shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate. The composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

TESTS

Acid value (2.5.1). Not more than 2.0, determined on 2.0 g.

Peroxide value (2.5.5). Not more than 10.0.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and prolonged heat; use freshly prepared solutions. If partial crystallisation has occurred, homogenise the material at a temperature of about 65 °C, but avoid prolonged heating.

Carry out the assay according to Method A. If the assay is not shown to be valid, use Method B.

Method A. Examine by ultraviolet absorption spectrophotometry (2.2.25). Dissolve 25 mg to 100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10 IU/ml to 15 IU/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_{λ}/A_{326} for each wavelength.

If the ratios do not exceed: 0.593 at 300 nm, 0.537 at 350 nm, 0.142 at 370 nm, calculate the content of vitamin A in International Units per gram from the expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the preparation to be examined, in grams,

V = total volume to which the preparation to be examined is diluted to give 10 IU/ml to 15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

If one or more of the ratios A_{λ}/A_{326} exceeds the values given, or if the wavelength of the absorption maximum does not lie between 325 nm and 327 nm, use Method B.

Method B. Examine by liquid chromatography (2.2.29).

Test solution (a). Introduce into a 50 ml volumetric flask, an amount of the preparation to be examined, weighed with an accuracy of 0.1 per cent and equivalent to about 120 000 IU of vitamin A and dissolve immediately in 5 ml of *pentane R*. Add 20 mg to 30 mg of *butylhydroxytoluene R* and 20 ml of 0.1 M *tetrabutylammonium hydroxide in 2-propanol*. Swirl gently for 5 min (an ultrasonic bath is recommended). Dilute to 50.0 ml with *2-propanol R* and homogenise carefully to avoid air-bubbles.

Test solution (b). Introduce 20 mg to 30 mg of *butylhydroxytoluene R* into a 50 ml volumetric flask, add 5 ml of *2-propanol R*, 5.0 ml of test solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

Reference solution (a). Introduce into a 50 ml volumetric flask about 120 mg of *retinol acetate CRS*, weighed with an accuracy of 0.1 per cent and proceed as described for test solution (a).

Reference solution (b). Introduce 20 mg to 30 mg of *butylhydroxytoluene R* into a 50 ml volumetric flask, add 5 ml of *2-propanol R*, 5.0 ml of reference solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of *water R* and 95 volumes of *methanol R*,

01/2005:0218

- as detector a spectrophotometer set at 325 nm,
- a loop injector.

The assay is not valid unless:

- the chromatogram obtained with reference solution (b) shows a principal peak corresponding to that of all-(*E*)-retinol, the retention time of all-(*E*)-retinol being about 3 min,
- there is no peak corresponding to the unsaponified retinol acetate in the chromatogram obtained with reference solution (b) at a retention time of about 6 min.

Inject a suitable volume of reference solution (b) in order to obtain an absorbance in the range of 0.5 to 1.0 at 325 nm and record the chromatogram using an attenuation so that the height of the peak corresponding to vitamin A is not less than 50 per cent of the full scale of the recorder.

Make a total of six such injections. The relative standard deviation of the response for reference solution (b) is not greater than 1 per cent.

Inject the same volume of test solution (b) and record the chromatogram in the same manner.

Calculate the content of vitamin A from the expression:

$$\frac{A_1 \times C \times m_2}{A_2 \times m_1}$$

- A_1 = area of the peak corresponding to all-(*E*)-retinol in the chromatogram obtained with test solution (b),
- A_2 = area of the peak corresponding to all-(*E*)-retinol in the chromatogram obtained with reference solution (b),
- C = concentration of *retinol acetate CRS* in International Units per gram, determined by method A; the absorption ratios A_λ/A_{326} must conform,
- m_1 = mass of the substance to be examined in test solution (a), in milligrams,
- m_2 = mass of *retinol acetate CRS* in reference solution (a), in milligrams.

STORAGE

Store in an airtight, well-filled container, protected from light.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units per gram,
- the name of the ester or esters,
- the name of any added stabilisers,
- the method of restoring the solution if partial crystallisation has occurred.

VITAMIN A CONCENTRATE (POWDER FORM), SYNTHETIC

Vitaminum A pulvis

DEFINITION

Synthetic vitamin A concentrate (powder form) is obtained by dispersing a synthetic retinol ester (0217) in a matrix of *Gelatin* (0330) or *Acacia* (0307) or other suitable material.

The declared content of vitamin A is not less than 250 000 IU/g and the concentrate contains not less than 95.0 per cent and not more than 115.0 per cent of the content stated on the label. The concentrate may contain suitable stabilisers such as antioxidants.

CHARACTERS

A yellowish powder usually in the form of particles of almost uniform size which, depending on their formulation, may be practically insoluble in water or may swell or form an emulsion.

IDENTIFICATION

Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄* plate R.

Test solution. Introduce into a 20 ml glass-stoppered test tube a quantity of the preparation to be examined containing about the equivalent of 17 000 IU of vitamin A. Add about 20 mg of *bromelains R*, 2 ml of *water R* and about 150 µl of *2-propanol R*, swirling gently for 2 to 5 min in a water-bath at 60 °C to 65 °C. Cool to below 30 °C and add 5 ml of *2-propanol R* containing 1 g/l of *butylhydroxytoluene R*. Shake vigorously for 1 min, allow to stand for a few minutes and use the supernatant solution.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *2-propanol R* containing 1 g/l of *butylhydroxytoluene R*.

Apply to the plate 3 µl of each solution. Develop immediately over a path of 15 cm using a mixture of 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The identification is not valid unless the chromatogram obtained with the reference solution shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate. The composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and prolonged heat.

Examine by liquid chromatography (2.2.29).

Test solution (a). Introduce into a 50 ml volumetric flask, an amount of the preparation to be examined, weighed with an accuracy of 0.1 per cent and equivalent to about 120 000 IU of vitamin A. Add 20 mg to 30 mg of *bromelains R*, 20 mg to 30 mg of *butylhydroxytoluene R*, 2.0 ml of *water R* and 0.15 ml of *2-propanol R*. Heat gently in a water-bath at 60 °C to 65 °C for 2 to 5 min. Cool to below 30 °C and add 20 ml of 0.1 M *tetrabutylammonium hydroxide in 2-propanol*. Swirl gently for 5 min (an ultrasonic bath is recommended). Dilute to 50.0 ml with *2-propanol R* and homogenise carefully to avoid air-bubbles. Residue of the matrix may cause more or less cloudiness of the solution.

Test solution (b). Introduce 20 mg to 30 mg of *butylhydroxytoluene R* into a 50 ml volumetric flask, add 5 ml of *2-propanol R*, 5.0 ml of test solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles. Filter before injection.

Reference solution (a). Introduce into a 50 ml volumetric flask about 120 mg of *retinol acetate CRS*, weighed with an accuracy of 0.1 per cent and dissolve immediately in 5 ml of *pentane R*. Add 20 mg to 30 mg of *butylhydroxytoluene R* and 20 ml of *0.1 M tetrabutylammonium hydroxide in 2-propanol*. Swirl gently for 5 min (an ultrasonic bath is recommended) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

Reference solution (b). Place 20 mg to 30 mg of *butylhydroxytoluene R* in a 50 ml volumetric flask, add 5 ml of *2-propanol R*, 5.0 ml of reference solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of *water R* and 95 volumes of *methanol R*,
- as detector a spectrophotometer set at 325 nm,
- a loop injector.

The assay is not valid unless:

- the chromatogram obtained with reference solution (b) shows a principal peak corresponding to that of all-(*E*)-retinol, the retention time of all-(*E*)-retinol being about 3 min,
- there is no peak corresponding to unsaponified retinol acetate in the chromatogram obtained with reference solution (b) at a retention time of about 6 min.

Inject a suitable volume of reference solution (b) in order to obtain an absorbance in the range of 0.5 to 1.0 at 325 nm and record the chromatogram using an attenuation so that the height of the peak corresponding to vitamin A is not less than 50 per cent of the full scale of the recorder.

Make a total of six injections. The relative standard deviation of the response for reference solution (b) should not be greater than 1 per cent.

Inject the same volume of test solution (b) and record the chromatogram in the same manner.

Calculate the content of vitamin A from the expression:

$$\frac{A_1 \times C \times m_2}{A_2 \times m_1}$$

- A_1 = area of the peak corresponding to all-(*E*)-retinol in the chromatogram obtained with test solution (b),
- A_2 = area of the peak corresponding to all-(*E*)-retinol in the chromatogram obtained with reference solution (b),
- C = concentration of *retinol acetate CRS* in International Units per gram, determined by the method below,
- m_1 = mass of the substance to be examined in test solution (a), in milligrams,
- m_2 = mass of *retinol acetate CRS* in reference solution (a), in milligrams.

The exact concentration of *retinol acetate CRS* is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dissolve 25 mg to 100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10 UI/ml to 15 UI/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_λ/A_{326} for each wavelength.

If the ratios do not exceed: 0.593 at 300 nm, 0.537 at 350 nm, 0.142 at 370 nm, calculate the content of vitamin A in International Units per gram from the expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the CRS, in grams,

V = total volume to which the CRS is diluted to give 10 UI/ml to 15 UI/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

The absorption ratios A_λ/A_{326} must conform.

STORAGE

Store in an airtight, well-filled container, protected from light.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units per gram,
- the name of the ester or esters,
- the name of the principal excipient or excipients used and the name of any added stabilisers.

01/2005:0220

VITAMIN A CONCENTRATE (SOLUBILISATE/EMULSION), SYNTHETIC

Vitaminum A in aqua dispergibile

DEFINITION

Synthetic Vitamin A concentrate (solubilisate/emulsion) is a liquid form (water is generally used as solvent) of a synthetic retinol ester (0217) and a suitable solubiliser. The declared content of vitamin A is not less than 100 000 UI/g and the concentrate contains not less than 95.0 per cent and not more than 115.0 per cent of the content stated on the label. The concentrate may contain suitable stabilisers such as antimicrobial preservatives and antioxidants.

CHARACTERS

A yellow or yellowish liquid of variable opalescence and viscosity. Highly concentrated solutions may become cloudy at low temperature or take the form of a gel.

A mixture of 1 g with 10 ml of *water R* previously warmed to 50 °C gives after cooling to 20 °C, a uniform, slightly opalescent and slightly yellow dispersion.

IDENTIFICATION

Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Introduce into a 20 ml glass-stoppered test-tube a quantity of the preparation to be examined containing about the equivalent of 17 000 IU of vitamin A. Add 5 ml of *2-propanol R* containing 1 g/l of *butylhydroxytoluene R* and mix thoroughly.

Reference solution. Prepare a 10 mg/ml solution of *retinol esters CRS* (i.e. 3.3 IU of each ester per microlitre) in *2-propanol R* containing 1 g/l of *butylhydroxytoluene R*.

Apply to the plate 3 µl of each solution. Develop immediately over a path of 15 cm using a mixture of 20 volumes of *ether R* and 80 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The identification is not valid unless the chromatogram obtained with the reference solution shows the individual spots of the corresponding esters. The elution order from bottom to top is: retinol acetate, retinol propionate and retinol palmitate. The composition of the test solution is confirmed by the correspondence of the principal spot or spots with those obtained with the reference solution.

ASSAY

Carry out the assay as rapidly as possible, avoiding exposure to actinic light and air, oxidising agents, oxidation catalysts (e.g. copper, iron), acids and prolonged heat.

Examine by liquid chromatography (2.2.29).

Test solution (a). Introduce into a 50 ml volumetric flask, an amount of the preparation to be examined, weighed with an accuracy of 0.1 per cent and equivalent to about 120 000 IU of vitamin A and dissolve immediately in 5 ml of *2-propanol R*. Add 20 mg to 30 mg of *butylhydroxytoluene R* and 20 ml of 0.1 M *tetrabutylammonium hydroxide in 2-propanol*. Swirl gently for 5 min (an ultrasonic bath is recommended). Dilute to 50.0 ml with *2-propanol R* and homogenise carefully to avoid air-bubbles.

Test solution (b). Introduce 20 mg to 30 mg of *butylhydroxytoluene R* into a 50 ml volumetric flask, add 5 ml of *2-propanol R*, 5.0 ml of test solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

Reference solution (a). Introduce into a 50 ml volumetric flask about 120 mg of *retinol acetate CRS*, weighed with an accuracy of 0.1 per cent and proceed as described for test solution (a).

Reference solution (b). Place 20 mg to 30 mg of *butylhydroxytoluene R* into a 50 ml volumetric flask, add 5 ml of *2-propanol R*, 5.0 ml of reference solution (a) and dilute to 50.0 ml with *2-propanol R*. Homogenise carefully to avoid air-bubbles.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.125 m long and 4 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1 ml/min a mixture of 5 volumes of *water R* and 95 volumes of *methanol R*,
- as detector a spectrophotometer set at 325 nm,
- a loop injector.

The assay is not valid unless:

- the chromatogram obtained with reference solution (b) shows a principal peak corresponding to that of all-(*E*)-retinol, the retention time of all-(*E*)-retinol being about 3 min,

- there is no peak corresponding to the unsaponified retinol acetate in the chromatogram obtained with reference solution (b) at a retention time of about 6 min.

Inject a suitable volume of reference solution (b) in order to obtain an absorbance in the range of 0.5 to 1.0 at 325 nm and record the chromatogram using an attenuation so that the height of the peak corresponding to vitamin A is not less than 50 per cent of the full scale of the recorder.

Make a total of six injections. The relative standard deviation of the response for reference solution (b) should not be greater than 1 per cent.

Inject the same volume of test solution (b) and record the chromatogram in the same manner.

Calculate the content of vitamin A from the expression:

$$\frac{A_1 \times C \times m_2}{A_2 \times m_1}$$

A_1 = area of the peak corresponding to all-(*E*)-retinol in the chromatogram obtained with test solution (b),

A_2 = area of the peak corresponding to all-(*E*)-retinol in the chromatogram obtained with reference solution (b),

C = concentration of *retinol acetate CRS* in International Units per gram, determined by the method below,

m_1 = mass of the substance to be examined in test solution (a), in milligrams,

m_2 = mass of *retinol acetate CRS* in reference solution (a), in milligrams.

The exact concentration of *retinol acetate CRS* is assessed by ultraviolet absorption spectrophotometry (2.2.25). Dissolve 25 mg to 100 mg, weighed with an accuracy of 0.1 per cent, in 5 ml of *pentane R* and dilute with *2-propanol R1* to a presumed concentration of 10 IU/ml to 15 IU/ml.

Verify that the absorption maximum of the solution lies between 325 nm and 327 nm and measure the absorbances at 300 nm, 326 nm, 350 nm and 370 nm. Repeat the readings at each wavelength and take the mean values. Calculate the ratio A_{λ}/A_{326} for each wavelength.

If the ratios do not exceed: 0.593 at 300 nm, 0.537 at 350 nm, 0.142 at 370 nm, calculate the content of vitamin A in International Units per gram from the expression:

$$\frac{A_{326} \times V \times 1900}{100 \times m}$$

A_{326} = absorbance at 326 nm,

m = mass of the CRS, in grams,

V = total volume to which the CRS is diluted to give 10 UI/ml to 15 IU/ml,

1900 = factor to convert the specific absorbance of esters of retinol into International Units per gram.

The absorption ratios A_{λ}/A_{326} must conform.

STORAGE

Store in an airtight container, protected from light, at the temperature stated on the label.

Once the container has been opened, its contents are to be used as soon as possible; any part of the contents not used at once should be protected by an atmosphere of inert gas.

LABELLING

The label states:

- the number of International Units per gram,
- the name of the ester or esters,
- the name of the principal solubiliser or solubilisers used and the name of any added stabilisers,
- the storage temperature.

01/2005:0698 *Test solution (b).* Dilute 2 ml of test solution (a) to 10 ml with *acetone R*.

WARFARIN SODIUM

Warfarinum natricum

$C_{19}H_{15}NaO_4$

M_r 330.3

DEFINITION

Warfarin sodium contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of sodium 2-oxo-3-[(1*RS*)-3-oxo-1-phenylbutyl]-2*H*-1-benzopyran-4-olate, calculated with reference to the anhydrous substance.

CHARACTERS

A white powder, hygroscopic, very soluble in water and in alcohol, soluble in acetone, very slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B, D, E.

Second identification: A, C, D, E.

- A. Dissolve 1 g in 25 ml of *water R*, add 2 ml of *dilute hydrochloric acid R* and filter. Reserve the filtrate for identification test E. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 159 °C to 163 °C.
- B. Dissolve 1 g in 25 ml of *water R*, add 2 ml of *dilute hydrochloric acid R* and filter. Reserve the filtrate for identification test E. Examine the precipitate by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with the precipitate prepared in the same manner from *warfarin sodium CRS*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).
- D. Dissolve 1 g in 10 ml of *water R*, add 5 ml of *nitric acid R* and filter. To the filtrate add 2 ml of *potassium dichromate solution RI* and shake for 5 min. Allow to stand for 20 min. The solution is not greenish-blue when compared with a blank.
- E. The filtrate obtained in identification test A or B gives reaction (b) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent. The pH of the solution is 7.6 to 8.6.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dilute 1 ml of test solution (b) to 200 ml with *acetone R*.

Reference solution (b). Dissolve 40 mg of *warfarin sodium CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *acenocoumarol CRS* in *acetone R*, add 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 50 volumes of *methylene chloride R* and 50 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained with reference solution (c) shows two clearly separated spots and the chromatogram obtained with reference solution (a) shows a clearly visible spot.

Phenolic ketones. Dissolve 1.25 g in a 20 g/l solution of *sodium hydroxide R* and dilute to 10.0 ml with the same solvent. The absorbance (2.2.25), measured at 385 nm within 15 min of preparing the solution, is not greater than 0.20.

Water (2.5.12). Not more than 4.0 per cent, determined on 0.750 g by the semi-micro determination of water.

ASSAY

Dissolve 0.1000 g in 0.01 *M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with 0.01 *M sodium hydroxide*. Dilute 10.0 ml of the latter solution to 100.0 ml with 0.01 *M sodium hydroxide*. Measure the absorbance (2.2.25) at the maximum at 308 nm.

Calculate the content of $C_{19}H_{15}NaO_4$ taking the specific absorbance to be 431.

STORAGE

Store in an airtight container, protected from light.

01/2005:0699

WARFARIN SODIUM CLATHRATE

Warfarinum natricum clathratum

DEFINITION

Warfarin sodium clathrate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of sodium 2-oxo-3-[(1*RS*)-3-oxo-1-phenylbutyl]-2*H*-1-benzopyran-4-olate, calculated with reference to the anhydrous, propan-2-ol-free substance. Warfarin sodium clathrate contains approximately 92 per cent of warfarin sodium. It consists of warfarin sodium and propan-2-ol (molecular proportions 2:1) in the form of a clathrate. It contains not less than 8.0 per cent and not more than 8.5 per cent of propan-2-ol.

CHARACTERS

A white powder, very soluble in water, freely soluble in alcohol, soluble in acetone, very slightly soluble in methylene chloride.

IDENTIFICATION

First identification: B, D, E.

Second identification: A, C, D, E.

- A. Dissolve 1 g in 25 ml of *water R*, add 2 ml of *dilute hydrochloric acid R* and filter. Reserve the filtrate for identification test E. The precipitate, washed with *water R* and dried at 100 °C to 105 °C, melts (2.2.14) at 159 °C to 163 °C.
- B. Dissolve 1 g in 25 ml of *water R*, add 2 ml of *dilute hydrochloric acid R* and filter. Reserve the filtrate for identification test E. Examine the precipitate by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with the precipitate prepared in the same manner from *warfarin sodium CRS*.
- C. Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position and size to the principal spot in the chromatogram obtained with reference solution (b).
- D. Dissolve 1 g in 10 ml of *water R*, add 5 ml of *nitric acid R* and filter. To the filtrate add 2 ml of *potassium dichromate solution R1* and shake for 5 min. Allow to stand for 20 min. The solution is greenish-blue when compared with a blank.
- E. The filtrate obtained in identification test A or B gives reaction (b) of sodium (2.3.1).

TESTS

Appearance of solution. Dissolve 1.0 g in *water R* and dilute to 20 ml with the same solvent. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dissolve 1.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent. The pH of the solution is 7.6 to 8.6.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *acetone R* and dilute to 10 ml with the same solvent.

Test solution (b). Dilute 2 ml of test solution (a) to 10 ml with *acetone R*.

Reference solution (a). Dilute 1 ml of test solution (b) to 200 ml with *acetone R*.

Reference solution (b). Dissolve 40 mg of *warfarin sodium CRS* in *acetone R* and dilute to 10 ml with the same solvent.

Reference solution (c). Dissolve 10 mg of *acenocoumarol CRS* in *acetone R*, add 1 ml of test solution (a) and dilute to 10 ml with *acetone R*.

Apply separately to the plate 20 µl of each solution. Develop over a path of 15 cm using a mixture of 20 volumes of *glacial acetic acid R*, 50 volumes of *methylene chloride R* and 50 volumes of *cyclohexane R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. Any spot in the chromatogram obtained with test solution (a), apart from the principal spot, is not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent). The test is not valid unless the chromatogram obtained

with reference solution (c) shows two clearly separated spots and the chromatogram obtained with reference solution (a) shows a clearly visible spot.

Phenolic ketones. Dissolve 1.25 g in a 20 g/l solution of *sodium hydroxide R* and dilute to 10.0 ml with the same solvent. The absorbance (2.2.25), measured at 385 nm within 15 min of preparing the solution, is not greater than 0.20.

Propan-2-ol: 8.0 per cent *m/m* to 8.5 per cent *m/m*, determined by gas chromatography (2.2.28) using *propanol R* as internal standard.

Internal standard solution. Dilute 1.0 ml of *propanol R* to 200.0 ml with *water R*.

Test solution (a). Dissolve 0.250 g of the substance to be examined in *water R* and dilute to 5.0 ml with the same solvent.

Test solution (b). Dissolve 0.50 g of the substance to be examined in the internal standard solution and dilute to 10.0 ml with the internal standard solution.

Reference solution. Dilute 0.50 ml of *propan-2-ol R* to 100.0 ml with the internal standard solution.

The chromatographic procedure may be carried out using:

- a column 1.5 m long and 4 mm in internal diameter packed with *ethylvinylbenzene-divinylbenzene copolymer R* (125 µm to 150 µm),
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 40 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 150 °C, that of the injection port at 180 °C and that of the detector at 200 °C. Inject the selected volumes of the test solutions and the reference solution. Calculate the content of propan-2-ol taking its density at 20 °C to be 0.785 g/ml.

Water (2.5.12). Not more than 0.1 per cent, determined on 2.500 g by the semi-micro determination of water.

ASSAY

Dissolve 0.1000 g in 0.01 *M sodium hydroxide* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of this solution to 100.0 ml with 0.01 *M sodium hydroxide*. Dilute 10.0 ml of the latter solution to 100.0 ml with 0.01 *M sodium hydroxide*. Measure the absorbance (2.2.25) at the maximum at 308 nm.

Calculate the content of $C_{19}H_{15}NaO_4$ taking the specific absorbance to be 431.

STORAGE

Store in an airtight container, protected from light.

WATER FOR INJECTIONS

Aqua ad iniectabilia

H₂O

M_r 18.02

DEFINITION

Water for the preparation of medicines for parenteral administration when water is used as vehicle (water for injections in bulk) and for dissolving or diluting substances or preparations for parenteral administration (sterilised water for injections).

Water for injections in bulk

PRODUCTION

Water for injections in bulk is obtained from water that complies with the regulations on water intended for human consumption laid down by the competent authority or from purified water by distillation in an apparatus of which the parts in contact with the water are of neutral glass, quartz or suitable metal and which is fitted with an effective device to prevent the entrainment of droplets. The correct maintenance of the apparatus is essential. The first portion of the distillate obtained when the apparatus begins to function is discarded and the distillate is collected.

During production and subsequent storage, appropriate measures are taken to ensure that the total viable aerobic count is adequately controlled and monitored. Appropriate alert and action limits are set so as to detect adverse trends. Under normal conditions, an appropriate action limit is a total viable aerobic count (2.6.12) of 10 micro-organisms per 100 ml when determined by membrane filtration, using agar medium S, using at least 200 ml of water for injections in bulk and incubating at 30-35 °C for 5 days. For aseptic processing, stricter alert limits may need to be applied.

Total organic carbon (2.2.44): maximum 0.5 mg/l.

Conductivity. Determine the conductivity off-line or in-line under the following conditions.

EQUIPMENT

Conductivity cell:

- electrodes of a suitable material such as stainless steel;
- cell constant: within 2 per cent of the given value determined using a certified reference solution with a conductivity less than 1500 µS·cm⁻¹.

Conductometer: resolution 0.1 µS·cm⁻¹ on the lowest range.

System calibration (conductivity cell and conductometer):

- against one or more suitable certified standard solutions;
- accuracy: within 3 per cent of the measured conductivity plus 0.1 µS·cm⁻¹.

Conductometer calibration: by means of precision resistors or equivalent devices, after disconnecting the conductivity cell, for all ranges used for conductivity measurement and cell calibration (with an accuracy within 0.1 per cent of the stated value, traceable to the official standard).

If in-line conductivity cells cannot be dismantled, system calibration may be performed against a calibrated conductivity cell placed close to the cell to be calibrated in the water flow.

PROCEDURE

Stage 1

1. Measure the conductivity without temperature compensation, recording simultaneously the temperature. Temperature-compensated measurement may be performed after suitable validation.
2. Using Table 0169-1, find the closest temperature value that is not greater than the measured temperature. The corresponding conductivity value is the limit at that temperature.
3. If the measured conductivity is not greater than the value in Table 0169-1, the water to be examined meets the requirements of the test for conductivity. If the conductivity is higher than the value in Table 0169-1, proceed with stage 2.

Table 0169-1. – Stage 1 - Temperature and conductivity requirements (for non-temperature-compensated conductivity measurements)

Temperature (°C)	Conductivity (µS·cm ⁻¹)
0	0.6
5	0.8
10	0.9
15	1.0
20	1.1
25	1.3
30	1.4
35	1.5
40	1.7
45	1.8
50	1.9
55	2.1
60	2.2
65	2.4
70	2.5
75	2.7
80	2.7
85	2.7
90	2.7
95	2.9
100	3.1

Stage 2

4. Transfer a sufficient amount of the water to be examined (100 ml or more) to a suitable container, and stir the test sample. Adjust the temperature, if necessary, and while maintaining it at 25 ± 1 °C, begin vigorously agitating the test sample while periodically observing the conductivity. When the change in conductivity (due to uptake of atmospheric carbon dioxide) is less than 0.1 µS·cm⁻¹ per 5 min, note the conductivity.
5. If the conductivity is not greater than 2.1 µS·cm⁻¹, the water to be examined meets the requirements of the test for conductivity. If the conductivity is greater than 2.1 µS·cm⁻¹, proceed with stage 3.

Stage 3

6. Perform this test within approximately 5 min of the conductivity determination in step 5 under stage 2, while maintaining the sample temperature at 25 ± 1 °C. Add a recently prepared saturated solution of *potassium chloride R* to the test sample (0.3 ml per 100 ml of the test sample), and determine the pH (2.2.3) to the nearest 0.1 pH unit.
7. Using Table 0169-2, determine the conductivity limit at the measured pH value in step 6. If the measured conductivity in step 4 under stage 2 is not greater than the conductivity requirements for the pH determined, the water to be examined meets the requirements of the test for conductivity. If either the measured conductivity is greater than this value or the pH is outside the range of 5.0-7.0, the water to be examined does not meet the requirements of the test for conductivity.

Table 0169.-2. — *Stage 3 - pH and conductivity requirements (for atmosphere and temperature equilibrated samples)*

pH	Conductivity ($\mu\text{S}\cdot\text{cm}^{-1}$)
5.0	4.7
5.1	4.1
5.2	3.6
5.3	3.3
5.4	3.0
5.5	2.8
5.6	2.6
5.7	2.5
5.8	2.4
5.9	2.4
6.0	2.4
6.1	2.4
6.2	2.5
6.3	2.4
6.4	2.3
6.5	2.2
6.6	2.1
6.7	2.6
6.8	3.1
6.9	3.8
7.0	4.6

In order to ensure the appropriate quality of the water, validated procedures and in-process-monitoring of the electrical conductivity and regular microbial monitoring are applied.

Water for injections in bulk is stored and distributed in conditions designed to prevent growth of micro-organisms and to avoid any other contamination.

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution (2 ppm NO₃) R*.

Aluminium (2.4.17): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Heavy metals (2.4.8): maximum 0.1 ppm.

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Bacterial endotoxins (2.6.14): less than 0.25 IU/ml.

Sterilised water for injections

DEFINITION

Water for injections in bulk that has been distributed into suitable containers, closed and sterilised by heat in conditions which ensure that the product still complies with the test for bacterial endotoxins. Sterilised water for injections is free from any added substances.

Examined in suitable conditions of visibility, it is clear and colourless.

Each container contains a sufficient quantity of water for injections to permit the nominal volume to be withdrawn.

TESTS

Acidity or alkalinity. To 20 ml add 0.05 ml of *phenol red solution R*. If the solution is yellow, it becomes red on the addition of 0.1 ml of 0.01 M *sodium hydroxide*; if red, it becomes yellow on the addition of 0.15 ml of 0.01 M *hydrochloric acid*.

Conductivity: maximum 25 $\mu\text{S}\cdot\text{cm}^{-1}$ for containers with a nominal volume of 10 ml or less; maximum 5 $\mu\text{S}\cdot\text{cm}^{-1}$ for containers with a nominal volume greater than 10 ml.

Use equipment and the calibration procedure as defined under Water for injections in bulk, maintaining the sample temperature at 25 ± 1 °C.

Oxidisable substances. Boil 100 ml with 10 ml of *dilute sulphuric acid R*. Add 0.2 ml of 0.02 M *potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Chlorides (2.4.4): maximum 0.5 ppm for containers with a nominal volume of 100 ml or less.

15 ml complies with the limit test for chlorides. Prepare the standard using a mixture of 1.5 ml of *chloride standard solution (5 ppm Cl) R* and 13.5 ml of *water R*. Examine the solutions down the vertical axes of the tubes.

For containers with a nominal volume greater than 100 ml, use the following test: to 10 ml add 1 ml of *dilute nitric acid R* and 0.2 ml of *silver nitrate solution R2*. The solution shows no change in appearance for at least 15 min.

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution (2 ppm NO₃) R*.

Sulphates. To 10 ml add 0.1 ml of *dilute hydrochloric acid R* and 0.1 ml of *barium chloride solution R1*. The solution shows no change in appearance for at least 1 h.

Aluminium (2.4.17): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Ammonium: maximum 0.2 ppm.

To 20 ml add 1 ml of *alkaline potassium tetraiodomercurate solution R*. After 5 min, examine the solution down the vertical axis of the tube. The solution is not more intensely coloured than a standard prepared at the same time by adding 1 ml of *alkaline potassium tetraiodomercurate solution R* to a mixture of 4 ml of *ammonium standard solution (1 ppm NH₄) R* and 16 ml of *ammonium-free water R*.

Calcium and magnesium. To 100 ml add 2 ml of *ammonium chloride buffer solution pH 10.0 R*, 50 mg of *mordant black 11 triturate R* and 0.5 ml of 0.01 M *sodium edetate*. A pure blue colour is produced.

Heavy metals (2.4.8): maximum 0.1 ppm.

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution (1 ppm Pb) R*.

Residue on evaporation: maximum 4 mg (0.004 per cent) for containers with a nominal volume of 10 ml or less; maximum 3 mg (0.003 per cent) for containers with a nominal volume greater than 10 ml.

Evaporate 100 ml to dryness on a water-bath and dry in an oven at 100-105 °C.

Particulate contamination: sub-visible particles (2.9.19). It complies with test A or test B, as appropriate.

Sterility (2.6.1). It complies with the test for sterility.

Bacterial endotoxins (2.6.14): less than 0.25 IU/ml.

Current production methods include for example double-pass reverse osmosis coupled with other suitable techniques such as ultrafiltration and deionisation. Correct operation and maintenance of the system is essential.

During production and subsequent storage, appropriate measures are taken to ensure that the total viable aerobic count is adequately controlled and monitored. Appropriate alert and action limits are set so as to detect adverse trends. Under normal conditions, an appropriate action limit is a total viable aerobic count (2.6.12) of 10 micro-organisms per 100 ml when determined by membrane filtration, using agar medium S, at least 200 ml of highly purified water and incubating at 30-35 °C for 5 days.

Total organic carbon (2.2.44): maximum 0.5 mg/l.

Conductivity. Determine the conductivity off-line or in-line under the following conditions.

EQUIPMENT

Conductivity cell:

- electrodes of a suitable material such as stainless steel;
- cell constant: within 2 per cent of the given value determined using a certified reference solution with a conductivity less than 1500 µS·cm⁻¹.

Conductometer: resolution 0.1 µS·cm⁻¹ on the lowest range.

System calibration (conductivity cell and conductometer):

- against one or more suitable certified standard solutions;
- accuracy: within 3 per cent of the measured conductivity plus 0.1 µS·cm⁻¹.

Conductometer calibration: by means of precision resistors or equivalent devices after disconnecting the conductivity cell, for all ranges used for conductivity measurement and cell calibration (with an accuracy within 0.1 per cent of the stated value, traceable to the official standard).

If in-line conductivity cells cannot be dismantled, system calibration may be performed against a calibrated conductivity cell placed close to the cell to be calibrated in the water flow.

PROCEDURE

Stage 1

1. Measure the conductivity without temperature compensation, recording simultaneously the temperature. Temperature-compensated measurement may be performed after suitable validation.
2. Using Table 1927-1, find the closest temperature value that is not greater than the measured temperature. The corresponding conductivity value is the limit at that temperature.
3. If the measured conductivity is not greater than the value in Table 1927-1, the water to be examined meets the requirements of the test for conductivity. If the conductivity is higher than the value in Table 1927-1, proceed with stage 2.

Stage 2

- Transfer a sufficient amount of the water to be examined (100 ml or more) to a suitable container, and stir the test sample. Adjust the temperature, if necessary, and while maintaining it at 25 ± 1 °C, begin vigorously agitating the test sample while periodically observing the conductivity. When the change in conductivity (due to uptake of atmospheric carbon dioxide) is less than $0.1 \mu\text{S}\cdot\text{cm}^{-1}$ per 5 min, note the conductivity.
- If the conductivity is not greater than $2.1 \mu\text{S}\cdot\text{cm}^{-1}$, the water to be examined meets the requirements of the test for conductivity. If the conductivity is greater than $2.1 \mu\text{S}\cdot\text{cm}^{-1}$, proceed with stage 3.

Stage 3

- Perform this test within approximately 5 min of the conductivity determination in step 5 under stage 2, while maintaining the sample temperature at 25 ± 1 °C. Add a recently prepared saturated solution of *potassium chloride R* to the test sample (0.3 ml per 100 ml of the test sample), and determine the pH (2.2.3) to the nearest 0.1 pH unit.
- Using Table 1927-2, determine the conductivity limit at the measured pH value in step 6. If the measured conductivity in step 4 under stage 2 is not greater than the conductivity requirements for the pH determined, the water to be examined meets the requirements of the test for conductivity. If either the measured conductivity is greater than this value or the pH is outside the range of 5.0-7.0, the water to be examined does not meet the requirements of the test for conductivity.

In order to ensure the appropriate quality of the water, validated procedures and in-process monitoring of the electrical conductivity and regular microbial monitoring are applied.

Highly purified water is stored in bulk and distributed in conditions designed to prevent growth of micro-organisms and to avoid any other contamination.

Table 1927-2. – Stage 3 - pH and conductivity requirements (for atmosphere and temperature equilibrated samples)

pH	Conductivity ($\mu\text{S}\cdot\text{cm}^{-1}$)
5.0	4.7
5.1	4.1
5.2	3.6
5.3	3.3
5.4	3.0
5.5	2.8
5.6	2.6
5.7	2.5
5.8	2.4
5.9	2.4
6.0	2.4
6.1	2.4
6.2	2.5
6.3	2.4
6.4	2.3
6.5	2.2
6.6	2.1
6.7	2.6
6.8	3.1
6.9	3.8
7.0	4.6

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution (2 ppm NO₃) R*.

Aluminium (2.4.17): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution (2 ppm Al) R*, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Heavy metals (2.4.8): maximum 0.1 ppm.

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution* (1 ppm Pb) R.

Bacterial endotoxins (2.6.14): less than 0.25 IU/ml.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

corrected

WATER, PURIFIED

Aqua purificata

H₂O *M_r* 18.02

DEFINITION

Water for the preparation of medicines other than those that are required to be both sterile and apyrogenic, unless otherwise justified and authorised.

Purified water in bulk

PRODUCTION

Purified water in bulk is prepared by distillation, by ion exchange, by reverse osmosis or by any other suitable method from water that complies with the regulations on water intended for human consumption laid down by the competent authority.

During production and subsequent storage, appropriate measures are taken to ensure that the total viable aerobic count is adequately controlled and monitored. Appropriate alert and action limits are set so as to detect adverse trends. Under normal conditions, an appropriate action limit is a total viable aerobic count (2.6.12) of 100 micro-organisms per millilitre, determined by membrane filtration, using agar medium S and incubating at 30-35 °C for 5 days. The size of the sample is to be chosen in relation to the expected result.

In addition, the test for total organic carbon (2.2.44) with a limit of 0.5 mg/l or alternatively the following test for oxidisable substances is carried out: to 100 ml add 10 ml of *dilute sulphuric acid R* and 0.1 ml of 0.02 M *potassium permanganate* and boil for 5 min; the solution remains faintly pink.

Conductivity. Determine the conductivity off-line or in-line under the following conditions.

EQUIPMENT

Conductivity cell:

- electrodes of a suitable material such as stainless steel;
- cell constant: within 2 per cent of the given value determined using a certified reference solution with a conductivity less than 1500 µS·cm⁻¹.

Conductometer: resolution 0.1 µS·cm⁻¹ on the lowest range.

System calibration (conductivity cell and conductometer):

- against one or more suitable certified standard solutions;
- accuracy: within 3 per cent of the measured conductivity plus 0.1 µS·cm⁻¹.

Conductometer calibration: by means of precision resistors or equivalent devices, after disconnecting the conductivity cell, for all ranges used for conductivity measurement and cell calibration (with an accuracy within 0.1 per cent of the stated value, traceable to the official standard).

If in-line conductivity cells cannot be dismantled, system calibration may be performed against a calibrated conductivity cell placed close to the cell to be calibrated in the water flow.

PROCEDURE

Measure the conductivity without temperature compensation, recording simultaneously the temperature. Temperature-compensated measurement may be performed after suitable validation.

The water to be examined meets the requirements if the measured conductivity at the recorded temperature is not greater than the value in Table 0008.-1.

Table 0008.-1. – *Temperature and conductivity requirements*

Temperature (°C)	Conductivity (µS·cm ⁻¹)
0	2.4
10	3.6
20	4.3
25	5.1
30	5.4
40	6.5
50	7.1
60	8.1
70	9.1
75	9.7
80	9.7
90	9.7
100	10.2

For temperatures not listed in Table 0008.-1, calculate the maximal permitted conductivity by interpolation between the next lower and next higher data points in the table.

Purified water in bulk is stored and distributed in conditions designed to prevent growth of micro-organisms and to avoid any other contamination.

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

Nitrates: maximum 0.2 ppm.

Place 5 ml in a test-tube immersed in iced water, add 0.4 ml of a 100 g/l solution of *potassium chloride R*, 0.1 ml of *diphenylamine solution R* and, dropwise with shaking, 5 ml of *nitrogen-free sulphuric acid R*. Transfer the tube to a water-bath at 50 °C. After 15 min, any blue colour in the solution is not more intense than that in a reference solution prepared at the same time in the same manner using a mixture of 4.5 ml of *nitrate-free water R* and 0.5 ml of *nitrate standard solution* (2 ppm NO₃) R.

Aluminium (2.4.17): maximum 10 ppb, if intended for use in the manufacture of dialysis solutions.

Prescribed solution. To 400 ml of the water to be examined add 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Reference solution. Mix 2 ml of *aluminium standard solution* (2 ppm Al) R, 10 ml of *acetate buffer solution pH 6.0 R* and 98 ml of *distilled water R*.

Blank solution. Mix 10 ml of *acetate buffer solution pH 6.0 R* and 100 ml of *distilled water R*.

Heavy metals (2.4.8): maximum 0.1 ppm.

01/2005:0359

Heat 200 ml in a glass evaporating dish on a water-bath until the volume is reduced to 20 ml. 12 ml of the concentrated solution complies with limit test A. Prepare the standard using 10 ml of *lead standard solution* (1 ppm Pb) R.

Bacterial endotoxins (2.6.14): less than 0.25 IU/ml, if intended for use in the manufacture of dialysis solutions without a further appropriate procedure for removal of bacterial endotoxins.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

Purified water in containers

DEFINITION

Purified water in bulk that has been filled and stored in conditions designed to assure the required microbiological quality. It is free from any added substances.

CHARACTERS

Appearance: clear and colourless liquid.

TESTS

It complies with the tests prescribed in the section on Purified water in bulk and with the following additional tests.

Acidity or alkalinity. To 10 ml, freshly boiled and cooled in a borosilicate glass flask, add 0.05 ml of *methyle red solution* R. The solution is not coloured red.

To 10 ml add 0.1 ml of *bromothymol blue solution* R1. The solution is not coloured blue.

Oxidisable substances. To 100 ml add 10 ml of *dilute sulphuric acid* R and 0.1 ml of 0.02 M *potassium permanganate* and boil for 5 min. The solution remains faintly pink.

Chlorides. To 10 ml add 1 ml of *dilute nitric acid* R and 0.2 ml of *silver nitrate solution* R2. The solution shows no change in appearance for at least 15 min.

Sulphates. To 10 ml add 0.1 ml of *dilute hydrochloric acid* R and 0.1 ml of *barium chloride solution* R1. The solution shows no change in appearance for at least 1 h.

Ammonium: maximum 0.2 ppm.

To 20 ml add 1 ml of *alkaline potassium tetraiodomercurate solution* R. After 5 min, examine the solution down the vertical axis of the tube. The solution is not more intensely coloured than a standard prepared at the same time by adding 1 ml of *alkaline potassium tetraiodomercurate solution* R to a mixture of 4 ml of *ammonium standard solution* (1 ppm NH₄) R and 16 ml of *ammonium-free water* R.

Calcium and magnesium. To 100 ml add 2 ml of *ammonium chloride buffer solution* pH 10.0 R, 50 mg of *mordant black 11 triturate* R and 0.5 ml of 0.01 M *sodium edetate*. A pure blue colour is produced.

Residue on evaporation: maximum 0.001 per cent.

Evaporate 100 ml on a water-bath and dry in an oven at 100-105 °C. The residue weighs a maximum of 1 mg.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10² micro-organisms per millilitre, determined by membrane filtration, using agar medium B.

LABELLING

The label states, where applicable, that the substance is suitable for use in the manufacture of dialysis solutions.

WHEAT STARCH

Tritici amylum

DEFINITION

Wheat starch is obtained from the caryopsis of *Triticum aestivum* L. (*T. vulgare* Vill.).

CHARACTERS

Appearance: very fine, white powder which creaks when pressed between the fingers.

Solubility: practically insoluble in cold water and in alcohol.

Wheat starch does not contain starch grains of any other origin. It may contain a minute quantity, if any, of tissue fragments of the original plant.

IDENTIFICATION

- Examined under a microscope using equal volumes of *glycerol* R and *water* R, it presents large and small granules, and, very rarely, intermediate sizes. The large granules, 10 µm to 60 µm in diameter, are discoid or, more rarely, reniform when seen face-on. The central hilum and striations are invisible or barely visible and the granules sometimes show cracks on the edges. Seen in profile, the granules are elliptical and fusiform and the hilum appears as a slit along the main axis. The small granules, rounded or polyhedral, are 2 µm to 10 µm in diameter. Between crossed nicol prisms, the granules show a distinct black cross intersecting at the hilum.
- Suspend 1 g in 50 ml of *water* R, boil for 1 min and cool. A thin, cloudy mucilage is formed.
- To 1 ml of the mucilage obtained in identification test B, add 0.05 ml of *iodine solution* R1. A dark blue colour is produced which disappears on heating.

TESTS

pH (2.2.3): 4.5 to 7.0.

Shake 5.0 g with 25.0 ml of *carbon dioxide-free water* R for 60 s. Allow to stand for 15 min.

Foreign matter. Examined under a microscope using a mixture of equal volumes of *glycerol* R and *water* R, not more than traces of matter other than starch granules are present. No starch grains of any other origin are present.

Total protein: maximum 0.3 per cent of total protein (corresponding to 0.048 per cent N₂, conversion factor: 6.25), determined on 6.0 g by sulphuric acid digestion (2.5.9) modified as follows: wash any adhering particles from the neck into the flask with 25 ml of *sulphuric acid* R; continue the heating until a clear solution is obtained; add 45 ml of *strong sodium hydroxide solution* R.

Oxidising substances (2.5.30): maximum 20 ppm, calculated as H₂O₂.

Sulphur dioxide (2.5.29): maximum 50 ppm.

Iron (2.4.9): maximum 10 ppm.

Shake 1.5 g with 15 ml of *dilute hydrochloric acid* R. Filter. The filtrate complies with the limit test for iron.

Loss on drying (2.2.32): maximum 15.0 per cent, determined on 1.000 g by drying in an oven at 130 °C for 90 min.

Sulphated ash (2.4.14): maximum 0.6 per cent, determined on 1.0 g.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 bacteria and not more than 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

01/2005:1379

WHEAT-GERM OIL, REFINED

Tritici aestivi oleum raffinatum

DEFINITION

Fatty oil obtained from the germ of the grain of *Triticum aestivum* L. by cold expression or by other suitable mechanical means and/or by extraction. It is then refined. A suitable antioxidant may be added.

CHARACTERS

Appearance: clear, light yellow liquid.

Solubility: practically insoluble in water and in alcohol, miscible with light petroleum (40 °C to 60 °C).

Relative density: about 0.925.

Refractive index: about 1.475.

IDENTIFICATION

- A. Identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is similar to the type chromatogram for wheat-germ oil.
- B. It complies with the test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1): maximum 0.9. If intended for use in the manufacture of parenteral dosage forms: maximum 0.3.

Peroxide value (2.5.5): maximum 10.0. If intended for use in the manufacture of parenteral dosage forms: maximum 5.0.

Unsataponifiable matter (2.5.7): maximum 5.0 per cent, determined on 5.0 g.

Alkaline impurities (2.4.19). It complies with the test for alkaline impurities in fatty oils.

Composition of fatty acids. Gas chromatography (2.4.22, Method C). Use the mixture of calibrating substances in Table 2.4.22-3.

Composition of the fatty-acid fraction of the oil:

- *palmitic acid*: 14.0 per cent to 19.0 per cent,
- *stearic acid*: maximum 2.0 per cent,
- *oleic acid*: 12.0 per cent to 23.0 per cent,
- *linoleic acid*: 52.0 per cent to 59.0 per cent,
- *linolenic acid*: 3.0 per cent to 10.0 per cent,
- *eicosenoic acid*: maximum 2.0 per cent.

Brassicasterol (2.4.23): maximum 0.3 per cent of brassicasterol in the sterol fraction of the oil.

Water (2.5.32). If intended for use in the manufacture of parenteral dosage forms: maximum 0.1 per cent, determined on 5.00 g. Use a mixture of equal volumes of *methanol R* and *methylene chloride R* as solvent.

STORAGE

In an airtight, well-filled container, protected from light.

LABELLING

The label states:

- the name and concentration of any added antioxidant,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms,
- whether the oil is obtained by mechanical means, by extraction or by a combination of the two.

01/2005:1480

WHEAT-GERM OIL, VIRGIN

Tritici aestivi oleum virginale

DEFINITION

Virgin wheat-germ oil is the fatty oil obtained from the germ of the grain of *Triticum aestivum* L. by cold expression or other suitable mechanical means.

CHARACTERS

A clear, light yellow or golden-yellow liquid, practically insoluble in water and in alcohol, miscible with light petroleum (40 °C to 60 °C).

It has a relative density of about 0.925 and a refractive index of about 1.475.

IDENTIFICATION

- A. Carry out the identification of fatty oils by thin-layer chromatography (2.3.2). The chromatogram obtained is comparable with the typical chromatogram for wheat-germ oil.
- B. It complies with test for composition of fatty acids (see Tests).

TESTS

Acid value (2.5.1). Not more than 20.0, determined on 10.0 g.

Peroxide value (2.5.5). Not more than 15.0.

Unsataponifiable matter (2.5.7). Not more than 5.0 per cent, determined on 5.0 g.

Composition of fatty acids (2.4.22, Method C). The fatty-acid fraction of the oil has the following composition:

- *palmitic acid*: 14.0 per cent to 19.0 per cent,
- *stearic acid*: not more than 2.0 per cent,
- *oleic acid*: 12.0 per cent to 23.0 per cent,
- *linoleic acid*: 52.0 per cent to 59.0 per cent,
- *linolenic acid*: 3.0 per cent to 10.0 per cent,
- *eicosenoic acid*: not more than 2.0 per cent.

Brassicasterol (2.4.23). The sterol fraction of the oil contains not more than 0.3 per cent of brassicasterol.

Water (2.5.32). Not more than 0.1 per cent, determined on 5.00 g by the micro-determination of water. Use a mixture of equal volumes of *methanol R* and *methylene chloride R* as solvent.

STORAGE

Store in an airtight, well-filled container, protected from light.

01/2005:1855

WILD PANSY (FLOWERING AERIAL PARTS)

Violae herba cum flore

DEFINITION

Dried flowering aerial parts of *Viola arvensis* Murray and/or *Viola tricolor* L.

Content: minimum 1.5 per cent of flavonoids, expressed as violanthin ($C_{27}H_{30}O_{14}$; M_r 578.5) (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The stem is angular and hollow. The leaves are oval, petiolate, with a cordate base or elongated and obtuse, with lyrate stipules, divided in the middle. The flowers, with a long peduncle, are zygomorphic, with 5 oval, lanceolate sepals, an appendage pointed outwards and 5 petals of which the lower one bears a spur; in *Viola arvensis*, the petals are shorter than the calyx, the lower petal is cream coloured, with black lines, the 4 upper petals may be cream coloured or violet blue; in *Viola tricolor*, the petals are longer than the calyx and violet coloured, more or less tinged with yellow. The androecium consisting of 5 stamens bears at the apex a membranous connective appendage with 2 spurs. The trilocular ovary shows a short style and globular stigmata. The fruit are navicular capsules, three-lobed, yellowish brown, 5 mm to 10 mm long. The pale yellow, pyriform seeds are about 1 mm long, bearing a caruncle.

B. Reduce to a powder (355). The powder is greenish. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the epidermis of the leaves in surface view with wavy-walled cells and anomocytic stomata (2.8.3); conical unicellular covering trichomes, widened at the base and sharply pointed at the apex, with a striated cuticle; glandular trichomes with a multicellular head, and a short, multicellular stalk in the indentations of the leaf margins; cluster crystals of calcium oxalate, sometimes included in parenchyma; fragments of the corolla with wavy-walled epidermal cells, those from the mid-region papillose and with some extended to form flask or bottle-shaped projections, those from the base of the petals with covering trichomes up to about 300 µm long with characteristic hump-like swellings along their length; spherical or polyhedral pollen grains, 60 µm to 80 µm in diameter, with finely pitted exines and 5 pores (*Viola arvensis*) or 4 pores (*Viola tricolor*); occasional fragments of spiral and reticulate vessels and groups of fibres from the stem.

C. Thin-layer chromatography (2.2.27).

Test solution. Heat in a water-bath at 65 °C for 5 min, with frequent stirring, 2.0 g of the powdered drug (355) in 10 ml of *alcohol (70 per cent V/V) R*. Cool and filter.

Reference solution. Dissolve 2.5 mg of *rutin R*, 2.5 mg of *hyperoside R* and 1.0 mg of *caffeic acid R* in *methanol R* and dilute to 10 ml with the same solvent.

Plate: *TLC silica gel plate R*.

Mobile phase: *anhydrous formic acid R, acetic acid R, water R, ethyl acetate R* (11:11:27:100 V/V/V/V).

Application: 10 µl, as bands.

Development: over a path of 12 cm.

Drying: at 100-105 °C.

Detection: spray with a solution containing 10 g/l of *diphenylboric acid aminoethyl ester R* and 50 g/l of *macrogol 400 R* in *methanol R*. Allow the plate to dry in air for 30 min. Examine in ultraviolet light at 365 nm.

Results: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones may be present in the chromatogram obtained with the test solution.

Top of the plate	
Caffeic acid: a greenish-blue to light blue fluorescent zone	A blue fluorescent zone
Hyperoside: a yellowish-brown fluorescent zone	A yellowish-green fluorescent zone
Rutin: a yellowish-brown fluorescent zone	An intense yellowish-brown fluorescent zone (rutin)
	A yellowish-green fluorescent zone
	A yellowish-green fluorescent zone
	A yellowish-green fluorescent zone
Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 3 per cent.

Swelling index (2.8.4): minimum 9, determined on the powdered drug (355).

Loss on drying (2.2.32): maximum 12.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100-105 °C for 2 h.

Total ash (2.4.16): maximum 15.0 per cent.

ASSAY

Stock solution. In a 200 ml flask, introduce 0.300 g of the powdered drug (250) and 40 ml of *alcohol (60 per cent V/V) R*. Heat in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter through a plug of absorbent cotton into a 100 ml volumetric flask. Transfer the absorbent cotton with the drug residue back into the 200 ml flask, add 40 ml of *alcohol (60 per cent V/V) R* and heat again in a water-bath at 60 °C for 10 min, shaking frequently. Allow to cool and filter into the same 100 ml volumetric flask as used previously. Rinse the 200 ml flask with a further quantity of *alcohol (60 per cent V/V) R*, filter and transfer to the same 100 ml volumetric flask. Dilute to volume with *alcohol (60 per cent V/V) R* and filter.

Test solution. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial*

acetic acid R and transfer into a 25 ml volumetric flask. Rinse the round-bottomed flask with 3 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask as used previously. Add 10.0 ml of a solution containing 25.0 g/l of *boric acid R* and 20.0 g/l of *oxalic acid R* in *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Compensation liquid. Introduce 5.0 ml of the stock solution into a round-bottomed flask and evaporate to dryness under reduced pressure. Take up the residue with 8 ml of a mixture of 10 volumes of *methanol R* and 100 volumes of *glacial acetic acid R* and transfer into the same 25 ml volumetric flask as used previously. Add 10.0 ml of *anhydrous formic acid R* and dilute to 25.0 ml with *anhydrous acetic acid R*.

Measure the absorbance (2.2.25) of the test solution at 405 nm after 30 min.

Calculate the percentage content of total flavonoids, expressed as violanthin from the expression:

$$\frac{A \times 1.25}{m}$$

taking the specific absorbance of violanthin to be 400.

A = measured absorbance at 405 nm,

m = mass of the drug to be examined, in grams.

01/2005:1891

WILD THYME

Serpylli herba

DEFINITION

Whole or cut, dried, flowering aerial parts of *Thymus serpyllum* L.s.l.

Content: minimum 3.0 ml/kg of essential oil (dried drug).

CHARACTERS

Macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

A. The stem is much branched, up to about 1.5 mm in diameter, cylindrical or indistinctly quadrangular, green, reddish or purplish, the older stems brown and woody, the younger stems pubescent. The leaves are opposite, 3 mm to 12 mm long and up to 4 mm wide, elliptical to ovate-lanceolate with an obtuse apex, cuneate and shortly petiolate at the base; the margin is entire and markedly ciliate, especially near the base; both surfaces are more or less glabrous but distinctly punctate. The inflorescence is composed of about 6 to 12 flowers in rounded to ovoid, terminal heads. The calyx is tubular, two-lipped with the upper lip dividing to form 3 teeth, the lower lip with 2 teeth, edged with long hairs; inner surfaces strongly pubescent, the hairs forming a closed tube after flowering. The corolla is purplish-violet to red, two-lipped, the lower lip with 3 lobes, upper lip notched, inner surface strongly pubescent; stamens 4, epipetalous, projecting from the corolla tube.

B. Reduce to a powder (355). The powder is greyish-green to brownish-green. Examine under a microscope using *chloral hydrate solution R*. The powder shows the following diagnostic characters: fragments of the leaf epidermises with sinuous, slightly thickened anticlinal walls and stomata of the diacytic type (2.8.3); numerous covering trichomes on both epidermises and along the leaf margins, the majority short, conical, unicellular, with thickened and warty walls, fewer long, uniseriate, composed of up to 8 cells, slightly swollen at the joints, with moderately thickened walls; abundant glandular trichomes, mostly multicellular with a small, rounded, unicellular stalk and a large globular head composed of a number of indistinct, radiating cells containing brown secretion, others smaller, capitate, with unicellular stalk and a unicellular, globoid or ovoid head; purplish-violet fragments of the corolla, the outer epidermis with numerous covering and glandular trichomes, inner epidermis papillose; pollen grains spherical to elliptical, 30 µm to 40 µm in diameter, with a finely grained exine and 6 germinal pores.

C. Thin-layer chromatography (2.2.27).

Test solution. To 1.0 g of the powdered drug (355) add 5 ml of *methylene chloride R* and shake for 3 min. Filter through about 2 g of *anhydrous sodium sulphate R*.

Reference solution. Dissolve 5 mg of *thymol R* and 10 µl of *carvacrol R* in 10 ml of *methylene chloride R*.

Plate: TLC silica gel *F₂₅₄* plate *R*.

Mobile phase: *methylene chloride R*.

Application: 20 µl, as bands.

Development: over a path of 15 cm.

Drying: in air.

Detection A: examine in ultraviolet light at 254 nm.

Results A: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution.

Top of the plate	
Thymol: a quenching zone	A prominent quenching zone A quenching zone (thymol)
	Quenching zones
Reference solution	Test solution

Detection B: spray with *anisaldehyde solution R* using 10 ml for a plate 200 mm square and heat at 100-105 °C for 10 min.

Results B: see below the sequence of the zones present in the chromatograms obtained with the reference solution and the test solution. Furthermore, other zones are present in the lower third of the chromatogram obtained with the test solution. The intensity of the zones due to thymol and carvacrol depends upon the sample examined (chemotypes).

Reference solution	Test solution

TESTS

Foreign matter (2.8.2): maximum 3 per cent, determined on 30 g.

Foreign matter may also consist of acicular to linear-lanceolate leaves with a strongly bent margin, the adaxial surface showing covering trichomes shaped as pointed teeth with warty walls, the abaxial surface showing many types of warty covering trichomes: unicellular, straight or slightly curved, bicellular or tricellular, often elbow-shaped, and bicellular or tricellular, more or less straight (*Thymus vulgaris*, *Thymus zygis*).

Loss on drying (2.2.32): maximum 10.0 per cent, determined on 1.000 g of the powdered drug (355) by drying in an oven at 100–105 °C for 2 h.

Total ash (2.4.16): maximum 10.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1): maximum 3.0 per cent.

ASSAY

Carry out the determination of essential oils in vegetable drugs (2.8.12). Use 50.0 g of the cut drug, a 1000 ml round-bottomed flask and 500 ml of *water R* as the distillation liquid. Distil at a rate of 2–3 ml/min for 2 h without *xylene R* in the graduated tube.

WILLOW BARK

Salicis cortex

DEFINITION

Willow bark consists of the whole or fragmented dried bark of young branches or whole dried pieces of current year twigs of various species of genus *Salix* including *S. purpurea* L., *S. daphnoides* Vill. and *S. fragilis* L. The drug contains not less than 1.5 per cent of total salicylic derivatives, expressed as salicin ($C_{13}H_{18}O_7$; M_r 286.3), calculated with reference to the dried drug.

CHARACTERS

Willow bark is markedly bitter.

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The bark is 1 mm to 2 mm thick and occurs in flexible, elongated, quilled or curved pieces. The outer surface is smooth or slightly wrinkled longitudinally and greenish-yellow to brownish-grey. The inner surface is smooth or finely striated longitudinally and white, pale yellow or reddish-brown, depending on the species. The fracture is short in the outer part and coarsely fibrous in the inner region. The diameter of current year twigs is not more than 10 mm. The wood is white or pale yellow.
- B. Reduce to a powder (355). The powder is pale yellow, greenish-yellow or light brown. Examine under a microscope using *chloral hydrate solution R*. The powder shows: bundles of narrow fibres, up to about 600 µm long, with very thick walls and surrounded by a crystal sheath containing prism crystals of calcium oxalate; parenchyma of the cortex with thick, pitted and deeply beaded walls, and containing large cluster crystals of

calcium oxalate; uniseriate medullary rays; thickened and suberised cork cells. Groups of brownish collenchyma from the bud may be present. Twigs show, additionally, fragments of lignified fibres and vessels from the xylem.

- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel plate R*.

Test solution (a). To 1.0 g of the powdered drug (500) add 20 ml of *methanol R*; heat in a water-bath at about 50 °C, with frequent shaking, for 10 min. Cool and filter.

Test solution (b). To 5.0 ml of test solution (a) add 1.0 ml of a 50 g/l solution of *anhydrous sodium carbonate R* and heat in a water-bath at about 60 °C for 10 min. Cool and filter if necessary.

Reference solution. Dissolve 2.0 mg of *salicin R* in 1.0 ml of *methanol R*.

Apply to the plate as bands 20 µl of each. Develop over a path of 15 cm using a mixture of 8 volumes of *water R*, 15 volumes of *methanol R* and 77 volumes of *ethyl acetate R*. Allow the plate to dry in air. Spray with a mixture of 5 volumes of *sulphuric acid R* and 95 volumes of *methanol R*. Heat at 100 °C to 105 °C for 5 min and examine in daylight. The chromatogram obtained with the reference solution shows in the middle third a reddish-violet zone due to salicin. In the chromatogram obtained with test solution (a), the zone due to salicin appears with only slight to moderate intensity. In the chromatogram obtained with test solution (b) the zone due to salicin is clearly more intense and there are, above the zone due to salicin, one (salicortin or 2'-O-acetylsalicortin, or possibly two tremulacin) faint reddish-violet zones. Other blue, yellow or brown zones can occur in both chromatograms.

TESTS

Foreign matter (2.8.2). Not more than 3 per cent of twigs with a diameter greater than 10 mm, and not more than 2 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 11 per cent, determined on 1.000 g of the powdered drug (355), by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 10 per cent.

ASSAY

Examine by liquid chromatography (2.2.29), using *resorcinol R* as the internal standard.

Internal standard solution. Dissolve 50 mg of *resorcinol R* in 10 ml of *methanol R*.

Test solution. To 0.5 g of the powdered drug (355) add 50 ml of *methanol R* and heat under a reflux condenser for 30 min. Cool and filter. Take up the residue with 50 ml of *methanol R*. Proceed as above. Combine the filtrates and evaporate under reduced pressure. Take up the residue with 5.0 ml of *methanol R*, add 5.0 ml of 0.1 M *sodium hydroxide* and heat in a water-bath at about 60 °C under a reflux condenser, with frequent shaking for about 1 h. After cooling, add 0.5 ml of 1 M *hydrochloric acid*. Dilute the solution to 20.0 ml with a mixture of 50 volumes of *methanol R* and 50 volumes of *water R*. Add 1.0 ml of the internal standard solution to 10.0 ml of this solution. Filter through a membrane filter.

Reference solution (a). Dissolve 18.5 mg of *salicin R* in 10.0 ml of a mixture of 20 volumes of *water R* and 80 volumes of *methanol R* and add 1.0 ml of the internal standard solution.

Reference solution (b). Dissolve 1.0 mg of *picein R* in 1.0 ml of reference solution (a).

The chromatographic procedure may be carried out using:

- a stainless steel column, 0.10 m long and 3 mm or 4 mm in internal diameter, packed with *octadecylsilyl silica gel for chromatography R* (3 µm),
- as mobile phase at a flow rate of 1.0 ml/min a mixture of 1.8 volumes of *tetrahydrofuran R* and 98.2 volumes of *water R*, containing 0.5 per cent V/V of *phosphoric acid R*,
- as detector a spectrophotometer set at 270 nm,
- a loop injector.

Inject 10 µl of reference solution (b). The assay is not valid unless the resolution between the peaks corresponding to salicin and picein and between the peaks corresponding to picein and resorcinol is at least 1.5.

Inject five times 10 µl of reference solution (a).

Inject three times 10 µl of the test solution. Continue the chromatography for four times the retention time of the peak corresponding to salicin.

Calculate the percentage content of total salicylic derivatives, expressed as salicin, from the expression:

$$\frac{S_1 \times S_4 \times m_2 \times p \times 2}{S_2 \times S_3 \times m_1}$$

- S_1 = area of the peak due to salicin in the chromatogram obtained with the test solution,
- S_2 = area of the peak due to resorcinol in the chromatogram obtained with the test solution,
- S_3 = area of the peak due to salicin in the chromatogram obtained with reference solution (a),
- S_4 = area of the peak due to resorcinol in the chromatogram obtained with reference solution (a),
- m_1 = mass of the drug in the test solution, in milligrams,
- m_2 = mass of salicin in reference solution (a), in milligrams,
- p = percentage content of salicin in the reference substance

STORAGE

Store protected from light.

01/2005:0593

WOOL ALCOHOLS

Alcoholes adipis lanae

DEFINITION

Mixture of sterols and higher aliphatic alcohols from wool fat. It may contain not more than 200 ppm of butylhydroxytoluene.

Content: minimum 30.0 per cent of cholesterol.

CHARACTERS

Appearance: pale-yellow or brownish-yellow, brittle mass becoming plastic on heating.

Solubility: practically insoluble in water, soluble in methylene chloride and in boiling ethanol, slightly soluble in alcohol (90 per cent V/V).

IDENTIFICATION

Dissolve 50 mg in 5 ml of *methylene chloride R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. Within a few seconds, a green colour develops.

TESTS

Appearance of solution. To 1.0 g add 10 ml of *light petroleum R1* and shake while warming in a water-bath. The substance dissolves completely. After cooling, the solution is clear (2.2.1).

Alkalinity. Dissolve 2.0 g in 25 ml of hot *alcohol (90 per cent V/V) R* and add 0.5 ml of *phenolphthalein solution R1*. No red colour develops.

Melting point (2.2.15): minimum 58 °C.

Melt the substance to be examined by heating in a water-bath at a temperature which exceeds the expected melting point by not more than 10 °C; introduce the substance to be examined into the capillary tubes and allow to stand at 15-17 °C for not less than 16 h.

Acid value (2.5.1): maximum 2.0.

If necessary, heat in a water-bath under a reflux condenser to dissolve the substance to be examined.

Hydroxyl value (2.5.3, Method A): 120 to 180.

Peroxide value (2.5.5, Method A): maximum 15.

Take from the substance to be examined wedge-shaped pieces whose base consists of part of the surface. Melt the pieces before carrying out the determination. Before adding 0.5 ml of *saturated potassium iodide solution R*, cool the solution obtained to room temperature.

Saponification value (2.5.6): maximum 12.0, determined on 2.00 g. Heat under reflux for 4 h.

Butylhydroxytoluene. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.20 g of *methyl decanoate R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Reference solution. Dissolve 0.20 g of *butylhydroxytoluene R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*. To 1.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Precolumn: column filled with silanised glass wool.

Column:

- *size:* $l = 1.5$ m, $\varnothing = 4$ mm,
- *stationary phase:* *silanised diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

- *column:* 150 °C,
- *injection port:* 180 °C,
- *detector:* 300 °C.

Detection: flame ionisation.

Limit:

– *butylhydroxytoluene*: maximum 200 ppm.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 2.000 g by drying in an oven at 100–105 °C.

Total ash (2.4.16): maximum 0.1 per cent.

Water-absorption capacity. Place 0.6 g of the substance to be examined and 9.4 g of *white soft paraffin R* in a mortar and melt on a water-bath. Allow to cool and incorporate 20 ml of *water R*, added in portions. Within 24 h no water is released from the almost white, ointment-like emulsion.

ASSAY

Dissolve 0.1000 g in 12 ml of hot *alcohol (90 per cent V/V) R*. Allow to stand for 18 h, filter through a sintered-glass filter (16) and wash the filter with 2 quantities, each of 15 ml, of *alcohol (90 per cent V/V) R*. Combine the filtrate and washings, add 20 ml of a freshly prepared 10 g/l solution of *digitonin R* in *alcohol (90 per cent V/V) R* and heat to about 60 °C. Allow to cool, filter through a sintered-glass filter (16), wash the residue with 10 ml of *alcohol (90 per cent V/V) R* and dry to constant mass at 100–105 °C.

1 g of residue is equivalent to 0.239 g of cholesterol.

STORAGE

In a well-filled container, protected from light.

LABELLING

The label states, where applicable, the concentration of any added butylhydroxytoluene.

01/2005:0134

WOOL FAT**Adeps lanae****DEFINITION**

Purified, anhydrous, waxy substance obtained from the wool of sheep (*Ovis aries*). It may contain not more than 200 ppm of butylhydroxytoluene.

CHARACTERS

Appearance: yellow, unctuous substance. When melted, it is a clear or almost clear, yellow liquid. A solution in light petroleum is opalescent.

Solubility: practically insoluble in water, slightly soluble in boiling ethanol.

It has a characteristic odour.

IDENTIFICATION

- A. In a test-tube, dissolve 0.5 g in 5 ml of *methylene chloride R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. A green colour develops.
- B. Dissolve 50 mg in 5 ml of *methylene chloride R*, add 5 ml of *sulphuric acid R* and shake. A red colour develops and an intense green fluorescence appears in the lower layer when examined in daylight, with illumination from the rear of the observer.

TESTS

Water-soluble acid or alkaline substances. Melt 5.0 g on a water-bath and shake vigorously for 2 min with 75 ml of *water R* previously heated to 90–95 °C. Allow to cool and filter through filter paper previously rinsed with *water R*. To 60 ml of the filtrate (which may not be clear) add 0.25 ml

of *bromothymol blue solution RI*. Not more than 0.2 ml of 0.02 M *hydrochloric acid* or 0.15 ml of 0.02 M *sodium hydroxide* is required to change the colour of the indicator.

Drop point (2.2.17): 38 °C to 44 °C.

To fill the metal cup, melt the wool fat on a water-bath, cool to about 50 °C, pour into the cup and allow to stand at 15–20 °C for 24 h.

Water-absorption capacity. Place 10 g in a mortar. Add *water R* in portions of 0.2 ml to 0.5 ml from a burette, stirring vigorously after each addition to incorporate the *water R*. The end-point is reached when visible droplets remain which cannot be incorporated. Not less than 20 ml of *water R* is absorbed.

Acid value (2.5.1): maximum 1.0, determined on 5.0 g dissolved in 25 ml of the prescribed mixture of solvents.

Peroxide value (2.5.5, *Method A*): maximum 20.

Before adding 0.5 ml of *saturated potassium iodide solution R*, cool the solution obtained to room temperature.

Saponification value (2.5.6): 90 to 105, determined on 2.00 g while heating under reflux for 4 h.

Water-soluble oxidisable substances. To 10 ml of the filtrate obtained in the test for water-soluble acid or alkaline substances add 1 ml of *dilute sulphuric acid R* and 0.1 ml of 0.02 M *potassium permanganate*. After 10 min, the solution is not completely decolourised.

Butylhydroxytoluene. Gas chromatography (2.2.28).

Internal standard solution. Dissolve 0.2 g of *methyl decanoate R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*.

Test solution (a). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R* and dilute to 10.0 ml with the same solvent.

Test solution (b). Dissolve 1.0 g of the substance to be examined in *carbon disulphide R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Reference solution. Dissolve 0.2 g of *butylhydroxytoluene R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 10.0 ml with *carbon disulphide R*. To 1.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Column:

- size: $l = 1.5$ m, $\varnothing = 4$ mm,
- stationary phase: *silanised diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*.

The column is preceded by a column containing silanised glass wool.

Carrier gas: *nitrogen for chromatography R*.

Flow rate: 40 ml/min.

Temperature:

- column: 150 °C,
- injection port: 180 °C,
- detector: 300 °C.

Detection: flame ionisation.

Limit:

– *butylhydroxytoluene*: maximum 200 ppm.

Paraffins: maximum 1.0 per cent.

The tap and cotton plugs used must be free from grease.

Prepare a column of anhydrous aluminium oxide 0.23 m long and 20 mm in diameter by adding a slurry of *anhydrous*

aluminium oxide R and *light petroleum R1* to a glass tube fitted with a tap and containing *light petroleum R1* (before use, dehydrate the anhydrous aluminium oxide by heating it in an oven at 600 °C for 3 h). Allow to settle and reduce the depth of the layer of solvent above the column to about 40 mm. Dissolve 3.0 g of the substance to be examined in 50 ml of warm *light petroleum R1*, cool, pass the solution through the column at a flow rate of 3 ml/min and wash with 250 ml of *light petroleum R1*. Concentrate the combined eluate and washings to low bulk by distillation, evaporate to dryness on a water-bath and heat the residue at 105 °C for periods of 10 min until 2 successive weighings do not differ by more than 1 mg. The residue weighs a maximum of 30 mg.

Pesticide residues: maximum 0.05 ppm for each organochlorine pesticide, 0.5 ppm for each other pesticide and 1 ppm for the sum of all the pesticides.

All glassware used is thoroughly washed using phosphate-free detergent as follows. The glassware is immersed in a bath of detergent solution (5 per cent in deionised water) and allowed to soak for 24 h. The detergent is washed off with copious amounts of acetone and hexane for pesticide analysis. It is important to keep glassware specifically for pesticide analyses, it must not be mixed up with glassware used for other applications. The glassware used must be free of chlorinated solvents, plastics and rubber materials, in particular phthalate plasticisers, oxygenated compounds and nitrogenated solvents such as acetonitrile. Use hexane, toluene and acetone for pesticide analysis. Use HPLC grade reagents for ethyl acetate, cyclohexane and water.

The test consists of the isolation of pesticide residues by size-exclusion chromatography (2.2.30) followed by solid phase extraction and identification by gas chromatography coupled with an electron capture detector or a thermionic detector.

ISOLATION OF THE PESTICIDE RESIDUES. As detector, use a UV-visible spectrophotometer set at a wavelength of 254 nm to calibrate the chromatographic column for gel permeation.

Calibration is extremely important in gel permeation chromatography to check that the pressure, solvent flow rate, solvent ratio, temperature and column conditions remain constant. The gel permeation column is to be calibrated at regular intervals using a standard mixture prepared as follows: into a 1000 ml volumetric flask, introduce 50.00 g of *maize oil R*, 2.00 g of *di(2-ethylhexyl) phthalate R*, 0.20 g of *methoxychlor R*, 50.0 mg of *perylene R*, 50.0 mg of *naphthalene R*, and 80.0 mg of *sulphur R*. Dilute to 1000.0 ml with a mixture of equal volumes of *cyclohexane R* and *ethyl acetate R*.

To calibrate the column, set the mobile phase at a flow rate of 5 ml/min with a mixture of equal volumes of *cyclohexane R* and *ethyl acetate R*. Inject 5 ml of the standard mixture and record the resulting chromatogram. The retention times for the analytes must not vary by more than ± 5 per cent between calibrations. If the retention time shift is greater than ± 5 per cent, take corrective action. Excessive retention time shifts may be caused by:

- poor laboratory temperature control,
- the pump contains air. This can be verified by measuring the flow rate: collect 25 ml of column eluate in a volumetric flask and record the time (300 ± 5 s),
- a leak in the system.

Changes in pressure, in mobile phase flow rate or in column temperature conditions, as well as column contamination, can affect pesticide retention times and are to be monitored. If the flow rate or column pressure are outside desired bands the guard column or column is to be replaced.

Test solution. In a volumetric flask, dissolve 1 g of wool fat, accurately weighed, in a mixture of 1 volume of *ethyl acetate R* and 7 volumes of *cyclohexane R*. Add 1 ml of an internal standard (2 ppm) either *isodrin R* or *ditalimphos R* and dilute to 20 ml. *The internal standard solutions are used to establish that recoveries of the pesticides from the GPC purification stage, evaporation and solid phase extraction stage are at acceptable levels. Recovery levels of the internal standard solutions from the wool fat are determined by comparing the peak areas of the wool fat extracts with peak areas of solutions of the internal standards.*

Guard column:

- size: $l = 0.075$ m, $\varnothing = 21.2$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (5 μ m).

Gel permeation column:

- size: $l = 0.3$ m, $\varnothing = 21.2$ mm,
- stationary phase: *styrene-divinylbenzene copolymer R* (5 μ m).

Mobile phase: *ethyl acetate R*, *cyclohexane R* (1:7 V/V).

Flow rate: 5 ml/min.

Detection: spectrophotometer at 254 nm.

Inject 5 ml of the test solution. Discard the first 95 ml (19 min) of eluate containing the substance to be examined. Collect the next 155 ml of eluate (31 min) containing any pesticide residues in an evaporating vessel.

Place the 155 ml of the eluate collected from the gel permeation chromatography column into an evaporating vessel. Place this vessel in an autoevaporator setting the water-bath temperature at 45 °C and the nitrogen pressure at 55 kPa. Evaporate the eluate down to 0.5 ml.

To prepare the solid phase extraction cartridges take some *magnesium silicate for pesticide residue analysis R* and heat it in a muffle furnace at 700 °C for 4 h to remove moisture and polychlorinated biphenyls. Subsequently allow the magnesium silicate to cool for 2 h and transfer it directly to an oven at 100-105 °C, and allow to stand for 30 min. Transfer the magnesium silicate to a stoppered glass jar and allow to equilibrate for 48 h. This material may be used for up to 2 weeks. After that period the magnesium silicate is to be reactivated, by heating at 600 °C for 2 h in a muffle furnace. Remove the magnesium silicate from the furnace, cool and store in a stoppered glass jar. The magnesium silicate is deactivated by adding 1 per cent of *water R*. After the water has been added, shake the magnesium silicate intermittently over 15 min just prior to use. The deactivated magnesium silicate is suitable for use for up to 1 week. It is essential that only deactivated magnesium silicate is used.

Take a 6 ml empty solid phase extraction cartridge and weigh into the cartridge 1 g of the deactivated magnesium silicate.

At this stage the GPC fraction still contains about 10 per cent of the substance to be examined, so further clean-up is necessary. A separate isolation procedure is carried out a) for organochlorine and synthetic pyrethroid pesticides and b) for organophosphorus pesticides. Place a preconditioned solid phase extraction cartridge containing 1 g of deactivated *magnesium silicate for pesticide residue analysis R* onto a vacuum manifold.

Condition the cartridge by adding 10 ml of *toluene R* and allowing the solvent to elute through the cartridge. Place the 0.5 ml of the solvent fraction from the evaporating vessel on the preconditioned cartridge. Elute the pesticide fractions from the cartridges using 20 ml of either of the 2 different solvent systems shown below:

a) for determination of the organochlorine and synthetic pyrethroid pesticides: *toluene R*. A very small amount of the substance to be examined is co-eluted,

b) for determination of the organophosphorus pesticides: a mixture of 2 volumes of *acetone R* and 98 volumes of *toluene R*. This solvent system is used to elute all the pesticides including the more polar organophosphorus pesticides. Unfortunately some of the substance to be examined is co-eluted with this solvent system, which can interfere with the electron capture detector.

Collect the eluate from the extraction cartridges in 25 ml glass vials. Quantitatively transfer the eluate to an evaporating vessel, washing the vial with 3 quantities, each of 10 ml, of *hexane R*.

Place the evaporating vessel on the autoevaporator and evaporate the solid phase extraction fractions down to 0.5 ml. The water-bath temperature is set at 45 °C and the nitrogen pressure is 55 kPa.

Examine the residues by gas chromatography (2.2.28) using electron capture and thermionic detectors as described below.

Recovery. Calculate the recovery correction factor (R_{cf}) of the internal standards (*ditalimphos R* or *isodrin R*) added to the test solution using the following expression:

$$\frac{\text{peak area of internal standard extracted from the test solution}}{\text{peak area of an internal standard 1 ppm in solution}} \times 100$$

5 ml of the 20 ml test solution containing 1 ml of 2 ppm internal standard concentrated to 0.5 ml is equivalent to 1 ppm of the internal standard in the solution.

If the recovery of the internal standards falls outside the range of 70 per cent to 110 per cent the test is not valid.

Reference solutions. Prepare reference solutions of pesticides using the pesticides standards at a concentration of 0.5 ppm (see composition of reference solutions A to D in Table 0134.-1). Commercially available pesticides may be purchased. The individual standards have a concentration of 10 ppm.

At the same time prepare solutions of pesticides equivalent to the limit of detection of the method (see recommended compositions in Table 0134.-1). These reference solutions are used to optimise the electron capture detector and thermionic detector to achieve the detection limits of the method (reference solutions E and F).

To prepare the reference solutions at the different concentrations use a calibrated pipette and volumetric flasks. To prepare the internal standard solutions G and H use a four-place analytical balance, pipette and volumetric flasks.

IDENTIFICATION AND QUANTIFICATION OF THE PESTICIDE

RESIDUES. To identify any pesticide residues compare the chromatograms obtained with chromatograms obtained with reference solutions A to D.

The identity of the pesticides can be confirmed by spiking samples or overlaying chromatograms using an integration package on a computer. The interpretation of pesticides in trace residue analyses is extremely complex. The detectors, particularly the electron capture detector, are prone to interference, both from the substance to be examined itself, and from solvents, reagents and apparatus used in the extraction. These peaks can easily be misinterpreted or quoted as a false positive. Confirmation of pesticides can be achieved by running samples and standards on different capillary columns (see chromatographic systems A or B described below). The peaks can be identified by using the information in Table 0134.-2.

Table 0134.-1. – Composition of the reference solutions

Reference solution A (0.5 ppm or 0.5 mg/l) (organochlorine and synthetic pyrethroid pesticides)	Reference solution B (0.5 ppm or 0.5 mg/l) (organochlorine and synthetic pyrethroid pesticides)

<i>o,p'-DDD R</i> (0.01 mg/l)	<i>Ethion R</i> (0.05 mg/l)
<i>Deltamethrin R</i> (0.1 mg/l)	<i>Fenchlorphos R</i> (0.05 mg/l)
<i>Endrin R</i> (0.01 mg/l)	<i>Propetamphos R</i> (0.05 mg/l)
<i>β-Hexachlorocyclohexane R</i> (0.01 mg/l)	
Reference solution G (internal standard organo- phosphorus pesticide)	Reference solution H (internal standard organo- chlorine pesticide)
<i>Ditalimphos R</i> (2 ppm or 2.0 mg/l)	<i>Isodrin R</i> (2 ppm or 2.0 mg/l)
<i>Ditalimphos R</i> (1 ppm or 1.0 mg/l)	<i>Isodrin R</i> (1 ppm or 1.0 mg/l)

A knowledge of the different responses the pesticides have with the 2 detectors is useful in identification of unknown peaks.

Once the pesticides have been identified, calculate the content of each pesticide using the following expression:

$$C_P = \frac{P_P \times D \times C_e}{P_e} \times \frac{100}{R_{cf}}$$

- C_P = concentration of identified pesticide (ppm),
 P_P = peak area of the individual pesticide in the test sample obtained,
 C_e = concentration of the individual pesticide in the external standard (ppm),

P_e = peak area of the individual pesticide in the external standard,
 D = dilution factor,
 R_{cf} = recovery correction factor.

The dilution factor (D) can be defined as follows:

$$\text{volume of sample obtained after the 2}^{\text{nd}} \text{ evaporation stage} \\ \text{sample weight} \times \frac{\text{GPC injection volume}}{\text{sample volumetric flask volume}}$$

Table 0134.-2. – *Elution order of the pesticides on chromatographic systems A and B*

Chromatographic system A	Chromatographic system B
Tecnazene	Tecnazene

Chromatographic system A:

Guard column:

- *material:* deactivated silica,
- *size:* $l = 4.5$ m, $\emptyset = 0.53$ mm.

Column:

- *material:* fused silica,
- *size:* $l = 60$ m, $\emptyset = 0.25$ mm,

– *stationary phase:* poly(dimethyl)(diphenyl)siloxane *R* (film thickness 0.25 μ m).

Carrier gas: helium for chromatography *R*.

Linear velocity: 25 cm/s.

Pressure: 180 kPa.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	75
	1 - 5	75 $\rightarrow$ 175
	5 - 30	175 $\rightarrow$ 275
	30 - 40	275 $\rightarrow$ 285
	40 - 55	285
Injection port		300
Detector		350

Detection: electron capture or thermionic specific detector.

Injection: 2 μ l.

Chromatographic system B which may be used for confirmation analysis:

Guard column:

- *material:* deactivated silica,
- *size:* $l = 4.5$ m, $\emptyset = 0.53$ mm.

Column:

- *material:* fused silica,
- *size:* $l = 60$ m, $\emptyset = 0.25$ mm,
- *stationary phase:* poly(cyanopropyl)(7)(phenyl)(7)(methyl)(86)siloxane *R* (film thickness 0.25 μ m).

Carrier gas: helium for chromatography *R*.

Linear velocity: 25 cm/s.

Pressure: 180 kPa.

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 1	75
	1 - 5	75 $\rightarrow$ 175
	5 - 30	175 $\rightarrow$ 275
	30 - 40	275 $\rightarrow$ 285
	40 - 55	285
Injection port		300
Detector		350

Detection: electron capture or thermionic specific detector.

Injection: 2 μ l.

Chlorides: maximum 150 ppm.

Boil 1.0 g with 20 ml of alcohol (90 per cent V/V) *R* in a round-bottomed flask fitted with a reflux condenser for 5 min. Cool, add 40 ml of water *R* and 0.5 ml of nitric acid *R* and filter. To the filtrate add 0.15 ml of a 10 g/l solution of silver nitrate *R* in alcohol (90 per cent V/V) *R*. Allow to stand for 5 min protected from light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by adding 0.15 ml of a 10 g/l solution of silver nitrate *R* in alcohol (90 per cent V/V) *R* to a mixture of 0.2 ml of 0.02 M hydrochloric acid, 20 ml of alcohol (90 per cent V/V) *R*, 40 ml of water *R* and 0.5 ml of nitric acid *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C for 1 h.

Sulphated ash (2.4.14): maximum 0.15 per cent.

Ignite 5.0 g and use the residue to determine the sulphated ash.

STORAGE

At a temperature not exceeding 25 °C.

LABELLING

The label states, where applicable, the concentration of added butylhydroxytoluene.

Saponification value (2.5.6): maximum 8.0. Heat under reflux for 4 h.

Fatty alcohols and sterols. Gas chromatography (2.2.28).

Test solution. Dissolve 0.25 g of the substance to be examined in 60 ml of *ethanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dissolve 0.25 g of *hydrogenated wool fat CRS* in 60 ml of *ethanol R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dissolve 50 mg of *cetyl alcohol CRS* and 50 mg of *stearyl alcohol CRS* in 60 ml of *ethanol R* and dilute to 100.0 ml with the same solvent.

Column:

- *material*: fused silica,
- *size*: $l = 30$ m, $\varnothing = 0.25$ mm,
- *stationary phase*: *poly(dimethyl)siloxane R* or another non-polar phase (film thickness: 0.25 µm).

Carrier gas: *helium for chromatography R* at a pressure of 100 kPa

Temperature:

	Time (min)	Temperature (°C)
Column	0 - 5	100
	5 - 45	100 → 300
	45 - 60	300
Injection port		325
Detector		350

Detection: flame ionisation.

Injection: 1 µl.

The chromatogram obtained with the test solution does not differ significantly from the chromatogram obtained with reference solution (a) (Figure 0969.-1) and it does not show enhanced peaks with retention times corresponding to cetyl alcohol and stearyl alcohol present in the chromatogram obtained with reference solution (b).

Heavy metals (2.4.8): maximum 10 ppm.

2.0 g complies with limit test C. Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32): maximum 3.0 per cent, determined on 2.000 g by drying in an oven at 100-105 °C for 1 h.

Total ash (2.4.16): maximum 0.1 per cent, determined on 5.0 g.

STORAGE

In a well-filled container, protected from light.

01/2005:0969

WOOL FAT, HYDROGENATED

Adeps lanae hydrogenatus

DEFINITION

Mixture of higher aliphatic alcohols and sterols obtained from the direct, high-pressure, high-temperature hydrogenation of *wool fat (0134)* during which the esters and acids present are reduced to the corresponding alcohols. It may contain butylhydroxytoluene.

CHARACTERS

Appearance: white or pale yellow, unctuous substance.

Solubility: practically insoluble in water, soluble in boiling alcohol and in light petroleum.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. It complies with the test for melting point (see Tests).
- B. Examine the chromatograms obtained in the test for fatty alcohols and sterols.

Results: the principal peaks in the chromatogram obtained with the test solution are similar in retention time and size to the principal peaks in the chromatogram obtained with reference solution (a).

- C. Dissolve 50 mg in 5 ml of *methylene chloride R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. A green colour is produced.

TESTS

Melting point (2.2.15): 45 °C to 55 °C. Allow to stand at 20 °C for 16 h.

Acid value (2.5.1): maximum 1.0, determined on 5.0 g.

Hydroxyl value (2.5.3, *Method A*): 140 to 180.

Figure 0969-1. – Chromatogram for the test for fatty alcohols and sterols (reference solution (a)) in hydrogenated wool fat

01/2005:0135

WOOL FAT, HYDROUS

Adeps lanae cum aqua

DEFINITION

Hydrous wool fat is a mixture of 75 per cent *m/m* of wool fat and 25 per cent *m/m* of water. It is obtained by the gradual addition of water to melted wool fat with continuous stirring. It may contain not more than 150 ppm of butylhydroxytoluene.

CHARACTERS

A pale yellow, unctuous substance.

IDENTIFICATION

- In a test-tube, dissolve 0.5 g in 5 ml of *chloroform R* and add 1 ml of *acetic anhydride R* and 0.1 ml of *sulphuric acid R*. A green colour develops.
- Dissolve 50 mg in 5 ml of *chloroform R*, add 5 ml of *sulphuric acid R* and shake. A red colour develops and an intense green fluorescence appears in the lower layer.

TESTS

Water-soluble acid or alkaline substances. Melt 6.7 g on a water-bath and shake vigorously for 2 min with 75 ml of *water R* previously heated to 90 °C to 95 °C. Allow to cool and filter through filter paper previously rinsed with *water R*. To 60 ml of the filtrate (which may not be clear) add 0.25 ml of *bromothymol blue solution R1*. Not more than 0.2 ml of 0.02 M *hydrochloric acid* or 0.15 ml of 0.02 M *sodium hydroxide* is required to change the colour of the indicator.

Drop point (2.2.17): 38 °C to 44 °C, determined on the residue obtained in the test for wool-fat content. To fill the metal cup, melt the residue on a water-bath, cool to about 50 °C, pour into the cup and allow to stand at 15 °C to 20 °C for 24 h.

Water-absorption capacity. Place 10 g of the residue obtained in the test for wool-fat content in a mortar. Add *water R* in portions of 0.2 ml to 0.5 ml from a burette, stirring vigorously after each addition to incorporate the *water R*. The end-point is reached when visible droplets remain which cannot be incorporated. Not less than 20 ml of *water R* is absorbed.

Acid value (2.5.1). Not more than 0.8, determined on 5.0 g dissolved in 25 ml of the prescribed mixture of solvents.

Peroxide value (2.5.5). Not more than 15.

Saponification value (2.5.6): 67 to 79, determined on 2.00 g. Heat under reflux for 4 h.

Water-soluble oxidisable substances. To 10 ml of the filtrate obtained in the test for water-soluble acid or alkaline substances add 1 ml of *dilute sulphuric acid R* and 0.1 ml of 0.02 M *potassium permanganate*. After 10 min, the solution is not completely decolourised.

Butylhydroxytoluene. Not more than 150 ppm, determined by gas chromatography (2.2.28), using *methyl decanoate R* as the internal standard.

Internal standard solution. Dissolve 0.2 g of *methyl decanoate R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *carbon disulphide R*.

Test solution (a). Dissolve 1.0 g of the residue obtained in the test for wool-fat content in *carbon disulphide R* and dilute to 10.0 ml with the same solvent.

01/2005:1380

Test solution (b). Dissolve 1.0 g of the residue obtained in the test for wool-fat content in *carbon disulphide R*, add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

Reference solution. Dissolve 0.2 g of *butylhydroxytoluene R* in *carbon disulphide R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with *carbon disulphide R*. To 1.0 ml of this solution add 1.0 ml of the internal standard solution and dilute to 10.0 ml with *carbon disulphide R*.

The chromatography may be carried out using:

- a column 1.5 m long and 4 mm in internal diameter packed with *silanised diatomaceous earth for gas chromatography R* impregnated with 10 per cent *m/m* of *poly(dimethyl)siloxane R*; the column is preceded by a column containing silanised glass wool,
- *nitrogen for chromatography R* as the carrier gas at a flow rate of 40 ml/min,
- a flame-ionisation detector.

Maintain the temperature of the column at 150 °C, that of the injection port at 180 °C and that of the detector at 300 °C. Inject the chosen volumes of test solutions (a) and (b) and of the reference solution.

Paraffins. *The tap and cotton plugs used must be free from grease.* Prepare a column of anhydrous aluminium oxide 230 mm long and 20 mm in diameter by adding a slurry of *anhydrous aluminium oxide R* and *light petroleum R1* to a glass tube fitted with a tap and containing *light petroleum R1*. Allow to settle and reduce the depth of the layer of solvent above the column to about 40 mm. Dissolve 3.0 g of the residue obtained in the test for wool-fat content in 50 ml of warm *light petroleum R1*, cool, pass the solution through the column at a rate of 3 ml/min and wash with 250 ml of *light petroleum R1*. Concentrate the combined eluate and washings to low bulk by distillation, evaporate to dryness on a water-bath and heat the residue at 105 °C for periods of 10 min until 2 successive weighings do not differ by more than 1 mg. The residue weighs not more than 30 mg (1.0 per cent).

Chlorides. Boil 1.3 g with 20 ml of *alcohol (90 per cent V/V) R* under a reflux condenser for 5 min. Cool, add 40 ml of *water R* and 0.5 ml of *nitric acid R* and filter. To the filtrate add 0.15 ml of a 10 g/l solution of *silver nitrate R* in *alcohol (90 per cent V/V) R*. Allow to stand for 5 min, protected from light. Any opalescence in the solution is not more intense than that in a standard prepared at the same time by adding 0.15 ml of a 10 g/l solution of *silver nitrate R* in *alcohol (90 per cent V/V) R* to a mixture of 0.2 ml of 0.02 *M hydrochloric acid*, 20 ml of *alcohol (90 per cent V/V) R*, 40 ml of *water R* and 0.5 ml of *nitric acid R* (115 ppm).

Sulphated ash (2.4.14). Not more than 0.1 per cent. Ignite 5.0 g and use the residue to determine the sulphated ash.

Wool-fat content: 72.5 per cent to 77.5 per cent. In a suitable tared dish containing a glass rod, heat 30.0 g to constant mass on a water-bath, stirring continuously. Weigh the residue.

STORAGE

Store at a temperature not exceeding 25 °C.

LABELLING

The label states, where applicable, the concentration of added butylhydroxytoluene.

WORMWOOD

Absinthii herba

DEFINITION

Wormwood consists of the basal leaves or slightly leafy, flowering tops, or of a mixture of these dried, whole or cut organs of *Artemisia absinthium* L. It contains not less than 2 ml/kg of essential oil, calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaves are greyish to greenish, densely tomentose on both surfaces. The basal leaves, with long petioles, have triangular to oval bipinnatisect to tripinnatisect lamina, with rounded to lanceolate segments. The cauline leaves are less segmented and the apical leaves are lanceolate. The stem of the flower-bearing region is greenish-grey, tomentose, up to 2.5 mm in diameter and usually with five flattened longitudinal grooves. The capitula are arranged as loose, axillary panicles, inserted at the level of the lanceolate to slightly pinnatisect leaves; they are spherical to flattened hemispherical, 2 mm to 4 mm in diameter and consist of a grey, tomentose involucre, the outer bracts linear, inner layer ovate, blunt at the apices with scarious margins, a receptacle with very long paleae up to 1 mm or more long, numerous yellow, tubular, hermaphroditic florets about 2 mm long and few yellow, ray florets.
- B. Reduce to a powder (355). The powder is greenish-grey. Examine under a microscope using *chloral hydrate solution R*. The powder shows many T-shaped trichomes with a short uniseriate stalk consisting of one to five small cells, perpendicularly capped by a very long, undulating terminal cell tapering at the ends; fragments of epidermises with sinuous to wavy walls, anomocytic stomata (2.8.3) and secretory trichomes each with a short, biseriate, two celled stalk and a biseriate head with two or four cells; fragments of the tubular and ray florets, some containing small cluster crystals of calcium oxalate; numerous paleae each composed of a small cell forming a stalk and a very long, cylindrical and thin-walled terminal cell about 1 mm to 1.5 mm long; spheroidal pollen grains, about 30 µm in diameter, with three pores and a finely warty exine; groups of fibres, small vessels with spiral and annular thickening, larger vessels with bordered pits and parenchyma with moderately thickened and pitted walls, from the stem.
- C. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Place 2 g of the powdered drug (355) in 50 ml of boiling *water R* and allow to stand for 5 min, shaking the flask several times. After cooling, add 5 ml of a 100 g/l solution of *lead acetate R*. Mix and filter. Rinse the flask and the residue on the filter with 20 ml of *water R*. Shake the filter with 50 ml of *methylene chloride R*. Separate the organic layer, dry over *anhydrous sodium sulphate R*, filter and evaporate the filtrate to dryness on a water-bath. Dissolve the residue in 0.5 ml of *alcohol R*.

Reference solution. Dissolve 2 mg of *methyl red R* and 2 mg of *resorcinol R* in 10.0 ml of *methanol R*.

Apply to the plate as bands 10 µl of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of *acetone R*, 10 volumes of *glacial acetic acid R*, 30 volumes of *toluene R* and 50 volumes of *methylene chloride R*. Allow the plate to dry in air. Spray the plate with *acetic anhydride-sulphuric acid solution R* and examine in daylight. The chromatogram obtained with the test solution shows the blue zone of artabsin shortly above the red zone of methyl red in the chromatogram obtained with the reference solution. Examine in daylight while heating at 100 °C to 105 °C for 5 min. The chromatogram obtained with the reference solution shows in the middle third the red zone of methyl red and below it the light pink zone of resorcinol. The chromatogram obtained with the test solution shows an intense red to brownish-red zone of absinthin with a similar R_f value to that of the zone due to resorcinol in the chromatogram obtained with the reference solution. Other zones are visible, but less intense than that of absinthin.

TESTS

Foreign matter (2.8.2). Not more than 5 per cent of stems with a diameter greater than 4 mm and 2 per cent of other foreign matter.

Bitterness value. Not less than 10 000. The bitterness value is determined by comparison with quinine hydrochloride, the bitterness value of which is set at 200 000; the bitterness value is the reciprocal of the dilution that still has a bitter taste.

Quinine hydrochloride stock solution. Dissolve 0.100 g of *quinine hydrochloride R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of the solution to 100.0 ml with *water R*.

Wormwood extract. To 1.0 g of powdered drug (710) add 1000 ml of boiling *water R*. Heat on a water-bath for 30 min, stirring continuously. Allow to cool and dilute to 1000 ml with *water R*. Shake vigorously and filter, discarding the first 20 ml of filtrate.

Prepare a series of dilutions by placing in the first tube 4.2 ml of quinine hydrochloride stock solution and increasing the volume by 0.2 ml in each subsequent tube to a total of 5.8 ml; dilute the contents of each tube to 10.0 ml with *water R*. Determine as follows the dilution with the lowest concentration that still has a bitter taste. Take 10.0 ml of the weakest solution into the mouth and pass it from side to side over the back of the tongue for 30 s. If the solution is not found to be bitter, spit it out and wait for 1 min. Rinse the mouth with *water R*. After 10 min, use the next dilution in order of increasing concentration.

Calculate the correction factor (k) from the expression:

$$\frac{5.00}{n}$$

n = number of millilitres of quinine hydrochloride stock solution in the dilution of lowest concentration that is bitter.

Dilute 10/ k ml of wormwood extract to 100.0 ml with *water R*. 10.0 ml of this dilution has a bitter taste.

Loss on drying (2.2.32). Not more than 10.0 per cent, determined on 1.000 g of powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 12.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 1.0 per cent.

ASSAY

Carry out the determination of essential oil in vegetable drugs (2.8.12). Use 50.0 g of the cut drug, a 1000 ml round-bottomed flask and 500 ml of *water R* as the distillation liquid. Add 0.5 ml of *xylene R* in the graduated tube. Distil at a rate of 2 ml/min to 3 ml/min for not less than 3 h.

STORAGE

Store protected from light.

01/2005:1277

XANTHAN GUM**Xanthani gummi****DEFINITION**

Xanthan gum is a high-molecular-mass anionic polysaccharide produced by fermentation of carbohydrate with *Xanthomonas campestris*. It consists of a principal chain of $\beta(1\rightarrow4)$ -linked D-glucose units with trisaccharide side chains, on alternating anhydroglucose units, consisting of a glucuronic acid unit included between two mannose units. Most of the terminal units contain a pyruvate moiety and the mannose unit adjacent to the principal chain may be acetylated at C-6.

Xanthan gum has a molecular mass of approximately 1×10^6 . It contains not less than 1.5 per cent of pyruvoyl groups ($C_3H_3O_2$; relative mass of the group 71.1), calculated with reference to the dried substance. Xanthan gum exists as the sodium, potassium or calcium salt.

CHARACTERS

A white or yellowish-white, free-flowing powder, soluble in water giving a highly viscous solution, practically insoluble in organic solvents.

IDENTIFICATION

- A. In a flask, suspend 1 g in 15 ml of 0.1 M hydrochloric acid. Close the flask with a fermentation bulb containing barium hydroxide solution R and heat carefully for 5 min. The barium hydroxide solution shows a white turbidity.
- B. To 300 ml of water R, previously heated to 80 °C and stirred rapidly with a mechanical stirrer in a 400 ml beaker, add, at the point of maximum agitation, a dry blend of 1.5 g of carob bean gum R and 1.5 g of the substance to be examined. Stir until the mixture forms a solution, and then continue stirring for 30 min or longer. Do not allow the water temperature to drop below 60 °C during stirring. Discontinue stirring and allow the mixture to stand for at least 2 h. A firm rubbery gel forms after the temperature drops below 40 °C but no such gel forms in a 1 per cent control solution of the sample prepared in the same manner but omitting the carob bean gum.

TESTS

pH (2.2.3). The pH of a 10.0 g/l solution is 6.0 to 8.0.

Viscosity (2.2.10). The viscosity at 24 ± 1 °C is not less than 600 mPa.s. Add 3.0 g within 45 s to 90 s into 250 ml of a 12 g/l solution of potassium chloride R in a 500 ml beaker stirring with a low-pitch propeller-type stirrer rotating at 800 r/min. When adding the substance take care that agglomerates are destroyed. Add an additional quantity of 44 ml of water R, to rinse any adhering residue from the walls of the beaker. Stir the preparation at 800 r/min for 2 h whilst maintaining the temperature at 24 ± 1 °C. Determine the viscosity within 15 min using a rotating viscosimeter set at 60 r/min and equipped with a rotating spindle 12.7 mm in diameter and 1.6 mm high which is attached to a shaft 3.2 mm in diameter. The distance from the top of the cylinder to the lower tip of the shaft being 25.4 mm, and the immersion depth being 50.0 mm.

2-Propanol. Not more than 750 ppm, determined by gas chromatography (2.2.28) using 2-methyl-2-propanol R as the internal standard.

Internal standard solution. Dilute 0.50 g of 2-methyl-2-propanol R to 500 ml with water R.

Test solution. To 200 ml of water R in a 1000 ml round-bottomed flask, add 5.0 g of the substance to be examined and 1 ml of a 10 g/l emulsion of dimeticone R in liquid paraffin R, stopper the flask and shake for 1 h. Distil about 90.0 ml, mix the distillate with 4.0 ml of the internal standard solution and dilute to 100.0 ml with water R.

Reference solution. Dilute a suitable quantity of 2-propanol R, accurately weighed, with water R to obtain a solution having a known concentration of 2-propanol of about 1 mg/ml. To 4.0 ml of this solution add 4.0 ml of the internal standard solution and dilute to 100.0 ml with water R.

The chromatographic procedure may be carried out using:

- a column 1.8 m long and 4.0 mm in internal diameter packed with styrene-divinylbenzene copolymer R,
- helium for chromatography R as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 165 °C, and that of the injection port and of the detector at 200 °C.

Inject 5 μ l of the test solution and 5 μ l of the reference solution. The retention time of 2-methyl-2-propanol is about 1.5 relative to that of 2-propanol.

Other polysaccharides. Examine by thin-layer chromatography (2.2.27), using a TLC silica gel plate R.

Test solution. To 10 mg in a thick-walled centrifuge test tube add 2 ml of a 230 g/l solution of trifluoroacetic acid R, shake vigorously to dissolve the forming gel, stopper the test tube, and heat the mixture at 120 °C for 1 h. Centrifuge the hydrolysate, transfer the clear supernatant liquid carefully into a 50 ml flask, add 10 ml of water R and evaporate the solution to dryness under reduced pressure. Take up the residue thus obtained in 10 ml of water R and evaporate to dryness under reduced pressure. Wash three times with 20 ml of methanol R and evaporate under reduced pressure. To the resulting clear film which has no odour of acetic acid, add 0.1 ml of water R and 1 ml of methanol R. Centrifuge to separate the amorphous precipitate. Dilute the supernatant liquid, if necessary, to 1 ml with methanol R.

Reference solution. Dissolve 10 mg of glucose R and 10 mg of mannose R in 2 ml of water R and dilute to 10 ml with methanol R.

Apply separately to the plate, as bands, 5 μ l of each solution. Develop over a path of 15 cm using a mixture of 10 volumes of a 16 g/l solution of sodium dihydrogen phosphate R, 40 volumes of butanol R and 50 volumes of acetone R. Spray evenly with a solution of 0.5 g of diphenylamine R in 25 ml of methanol R to which 0.5 ml of aniline R and 2.5 ml of phosphoric acid R have been added. Heat for 5 min at 120 °C. Examine in daylight. The test is not valid unless the chromatogram obtained with the reference solution shows two clearly separated greyish-brown zones due to glucose and mannose in the middle third. The chromatogram obtained with the test solution shows corresponding zones. In addition, one weak reddish and two faint bluish-grey bands may be visible just above the starting line. One or two bluish-grey bands may also be seen in the upper quarter of the chromatogram. No other bands are visible.

Loss on drying (2.2.32). Not more than 15.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C for 2.5 h.

Total ash (2.4.16): 6.5 per cent to 16.0 per cent.

Microbial contamination. Total viable aerobic count (2.6.12) not more than 10^3 bacteria and 10^2 fungi per gram, determined by plate count. It complies with the test for *Escherichia coli* (2.6.13).

ASSAY

Test solution. Dissolve a quantity of the substance to be examined corresponding to 120.0 mg of the dried substance in *water R* and dilute to 20.0 ml with the same solvent.

Reference solution. Dissolve 45.0 mg of *pyruvic acid R* in *water R* and dilute to 500.0 ml with the same solvent.

Place 10.0 ml of the test solution in a 50 ml round-bottomed flask, add 20.0 ml of *0.1 M hydrochloric acid* and weigh. Boil on a water-bath under a reflux condenser for 3 h. Weigh and adjust to the initial mass with *water R*. In a separating funnel mix 2.0 ml of the solution with 1.0 ml of *dinitrophenylhydrazine-hydrochloric solution R*. Allow to stand for 5 min and add 5.0 ml of *ethyl acetate R*. Shake and allow the solids to settle. Collect the upper layer and shake with three quantities, each of 5.0 ml, of *sodium carbonate solution R*. Combine the aqueous layers and dilute to 50.0 ml with *sodium carbonate solution R*. Mix. Treat 10.0 ml of the reference solution at the same time and in the same manner as for the test solution.

Immediately measure the absorbance of the two solutions (2.2.25) at 375 nm, using *sodium carbonate solution R* as the compensation liquid.

The absorbance of the test solution is not less than that of the reference solution, which corresponds to a content of pyruvic acid of not less than 1.5 per cent.

pH (2.2.3): 4.0 to 5.5 for solution S.

Impurity A: maximum 100 ppm.

Solution A. Dissolve 0.25 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent. This solution is used to prepare the test solution.

Solution B. Dissolve 50 mg of 2,6-dimethylaniline R in methanol R and dilute to 100 ml with the same solvent. Dilute 1 ml of the solution to 100 ml with methanol R. This solution is used to prepare the reference solution.

Using 2 flat-bottomed tubes with an inner diameter of about 10 mm, place in the first tube 2 ml of solution A, and in the second tube 1 ml of solution B and 1 ml of *methanol R*. To each tube add 1 ml of a freshly prepared 10 g/l solution of *dimethylaminobenzaldehyde R* in *methanol R* and 2 ml of *glacial acetic acid R* and allow to stand at room temperature for 10 min. Compare the colours in diffused daylight, viewing vertically against a white background. Any yellow colour in the test solution is not more intense than that in the reference solution.

Related substances. Liquid chromatography (2.2.29).
Prepare the solutions immediately before use.

Solvent mixture. Mix 8 volumes of *acetonitrile R*, 30 volumes of *methanol R* and 62 volumes of a 2.72 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 7.2 with *dilute sodium hydroxide solution R*.

Test solution. Dissolve 0.100 g of the substance to be examined in the solvent mixture and dilute to 20.0 ml with the solvent mixture.

Reference solution. Dissolve 5.0 mg of the substance to be examined, 5.0 mg of 2,6-dimethylaniline R, 5.0 mg of xylazine impurity C CRS and 5.0 mg of xylazine impurity E CRS in acetonitrile R and dilute to 100.0 ml with the same solvent. Dilute 1.0 ml of this solution to 10.0 ml with the solvent mixture.

Column:

- size: $l = 0.15$ m, $\varnothing = 3.9$ mm,
- stationary phase: end-capped octylsilyl silica gel for chromatography with polar incorporated groups R (5 μm),
- temperature: 40 °C.

Mobile phase:

- *mobile phase A*: mix 30 volumes of *methanol R* and 70 volumes of a 2.72 g/l solution of *potassium dihydrogen phosphate R* adjusted to pH 7.2 with *dilute sodium hydroxide solution R*,
- *mobile phase B*: *methanol R*, *acetonitrile R* (30:70 V/V).

Time (min)	Mobile phase A (per cent V/V)	Mobile phase B (per cent V/V)
0 - 15	89 $\rightarrow$ 28	11 $\rightarrow$ 72
15 - 21	28	72
21 - 22	28 $\rightarrow$ 89	72 $\rightarrow$ 11
22 - 33	89	11

Flow rate: 1.0 ml/min.

Detection: spectrophotometer at 230 nm.

Equilibration: for at least 30 min with a mixture of 28 volumes of mobile phase A and 72 volumes of mobile phase B.

Injection: 20 μ l.

Relative retention with reference to xylazine (retention time = about 7.5 min): impurity A = about 0.8; impurity E = about 1.6; impurity C = about 2.2.

XYLAZINE HYDROCHLORIDE FOR VETERINARY USE

Xylazini hydrochloridum ad usum
veterinarium

$$\text{C}_{12}\text{H}_{17}\text{ClN}_2\text{S}$$
 M_v 256.8

DEFINITION

N-(2,6-Dimethylphenyl)-5,6-dihydro-4*H*-1,3-thiazin-2-amine hydrochloride.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: white or almost white, crystalline powder, hygroscopic.

Solubility: freely soluble in water, very soluble in methanol, freely soluble in methylene chloride.

IDENTIFICATION

A. Infrared absorption spectrophotometry (2.2.24).

Preparation: discs.

Comparison: xylazine hydrochloride CRS.

B. It gives reaction (b) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 5.0 g in carbon dioxide-free water *R* prepared from distilled water *R*, heating at 60 °C if necessary; allow to cool and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

System suitability: reference solution:

- *resolution:* minimum 4.0 between the peaks due to impurity A and xylazine.

Limits:

- *impurities C, E:* for each impurity, not more than twice the area of the corresponding peak in the chromatogram obtained with the reference solution (0.2 per cent),
- *impurities B, D:* for each impurity, not more than twice the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.2 per cent),
- *any other impurity:* for each impurity, not more than twice the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.2 per cent),
- *total of impurities other than B, C, D and E:* not more than twice the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.2 per cent),
- *disregard limit:* 0.5 times the area of the peak due to xylazine in the chromatogram obtained with the reference solution (0.05 per cent); disregard any peak due to the blank.

Heavy metals (2.4.8): maximum 10 ppm.

12 ml of solution S complies with limit test A. Prepare the standard using 10 ml of *lead standard solution* (1 ppm Pb) R.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 100–105 °C for 2 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of *alcohol R*. Add 25 ml of *water R*. Titrate with 0.1 M *sodium hydroxide*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *sodium hydroxide* is equivalent to 25.68 mg of C₁₂H₁₇ClN₂S.

STORAGE

In an airtight container, protected from light.

IMPURITIES

Specified impurities: A, B, C, D, E.

- A. R = NH₂: 2,6-dimethylaniline (2,6-xylidine),
- C. R = N=C=S: 2,6-dimethylphenyl isothiocyanate,
- D. R = NH-CS-NH-[CH₂]₃-OH: *N*-(2,6-dimethylphenyl)-*N'*-(3-hydroxypropyl)thiourea,
- E. R = NH-CS-S-CH₃: methyl (2,6-dimethylphenyl)carbamodithioate,

- B. *N,N'*-bis(2,6-dimethylphenyl)thiourea.

XYLITOL

Xylitolum

C₅H₁₂O₅

*M*_r 152.1

DEFINITION

Xylitol contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of *meso*-xylitol, calculated with reference to the anhydrous substance.

CHARACTERS

White crystalline powder or crystals, very soluble in water, sparingly soluble in alcohol.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Melting point (2.2.14): 92 °C to 96 °C.
- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *xylitol CRS*. Examine the substance prepared as a mull in *liquid paraffin R*.
- C. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel G plate R*.

Test solution. Dissolve 25 mg of the substance to be examined in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (a). Dissolve 25 mg of *xylitol CRS* in *water R* and dilute to 5.0 ml with the same solvent.

Reference solution (b). Dissolve 25 mg of *mannitol CRS* and 25 mg of *xylitol CRS* in *water R* and dilute to 5 ml with the same solvent.

Apply to the plate 2 µl of each solution. Develop over a path of 17 cm using a mixture of 10 volumes of *water R*, 20 volumes of *ethyl acetate R* and 70 volumes of *propanol R*. Allow the plate to dry in air and spray with 4-aminobenzoic acid solution R. Dry the plate in a current of cold air until the acetone is removed. Heat the plate at 100 °C for 15 min. Allow to cool and spray with a 2 g/l solution of *sodium periodate R*. Dry the plate in a current of cold air. Heat the plate at 100 °C for 15 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

TESTS

Appearance of solution. Dissolve 2.5 g in *water R* and dilute to 50.0 ml with the same solvent. The solution is not more opalescent than reference suspension IV (2.2.1) and not more intensely coloured than reference solution BY₇ (2.2.2, *Method II*).

Conductivity (2.2.38). Not more than 20 µS·cm⁻¹.

Dissolve 20.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100.0 ml with the same solvent. Measure the conductivity of the solution while gently stirring with a magnetic stirrer.

Reducing sugars. Dissolve 5.0 g in 6 ml of *water R* with the aid of gentle heat. Cool and add 20 ml of *cupri-citric solution R* and a few glass beads. Heat so that boiling begins after 4 min and maintain boiling for 3 min. Cool rapidly and add 100 ml of a 2.4 per cent *V/V* solution of *glacial acetic acid R* and 20.0 ml of 0.025 *M* *iodine*. With continuous shaking, add 25 ml of a mixture of 6 volumes of *hydrochloric acid R* and 94 volumes of *water R* and, when the precipitate has dissolved, titrate the excess of iodine with 0.05 *M* *sodium thiosulphate* using 1 ml of *starch solution R*, added towards the end of the titration, as indicator. Not less than 12.8 ml of 0.05 *M* *sodium thiosulphate* is required (0.2 per cent, calculated as glucose equivalent).

Related products. Examine by gas chromatography (2.2.28) as described under Assay. The sum of the percentage contents of the related products in the chromatogram obtained with the test solution is not greater than 2.0 per cent.

Lead (2.4.10). It complies with the limit test for lead in sugars (0.5 ppm). Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Nickel (2.4.15). It complies with the limit test for nickel in polyols (1 ppm). Dissolve the substance to be examined in 150.0 ml of the prescribed mixture of solvents.

Water (2.5.12). Not more than 1.0 per cent, determined on 1.00 g by the semi-micro determination of water.

Bacterial endotoxins (2.6.14): if intended for use in the manufacture of parenteral dosage forms without a further appropriate procedure for the removal of bacterial endotoxins, less than 4 IU/g for parenteral dosage forms having a concentration of less than 100 g/l of xylitol and less than 2.5 IU/g for parenteral dosage forms having a concentration of 100 g/l or more of xylitol.

ASSAY

Examine by gas chromatography (2.2.28), using erythritol as the internal standard.

Internal standard solution. Dissolve 5 mg of *erythritol R* in *water R* and dilute to 25.0 ml with the same solvent.

Test solution. Dissolve 5.000 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve 25.0 mg each of *L-arabinitol CRS*, *galactitol CRS*, *mannitol CRS* and *sorbitol CRS* in *water R* and dilute to 100.0 ml with the same solvent. To 10.0 ml of the solution add about 490 mg of *xylitol CRS*, accurately weighed, to obtain a solution having a known concentration of about 49 mg of *xylitol CRS* per millilitre.

The chromatographic procedure may be carried out using:

- a stainless steel column 2 m long and 2 mm in internal diameter packed with acid washed *silanised diatomaceous earth for gas chromatography R* (150–180 µm) and impregnated with 3 per cent *m/m* of *poly[(cyanopropyl)(methyl)](phenyl)(methyl)siloxane R*,
- *nitrogen R* as the carrier gas at a flow rate of 30 ml/min,
- a flame-ionisation detector,

maintaining the temperature of the column at 170 °C for 1 min, then raising the temperature at a rate of 6 °C/min to 200 °C and maintaining the temperature of the injection port and of the detector at 250 °C.

Pipet 1.0 ml of the reference solution and 1.0 ml of the test solution into separate 100 ml round-bottomed flasks. To each flask, add 1.0 ml of the internal standard solution and evaporate the respective mixtures to dryness in a water-bath at 60 °C with the aid of a rotary evaporator. Dissolve each dry residue in 1 ml of *anhydrous pyridine R* and add 1 ml of *acetic anhydride R* to each flask and boil each solution under reflux for 1 h to complete acetylation.

Inject 1 µl each of the solutions obtained from the reference solution and the test solution.

When the chromatograms are recorded in the prescribed conditions, the relative retentions calculated with reference to xylitol are: erythritol about 0.3, arabinitol about 0.7, mannitol about 1.8, galactitol about 2.0 and sorbitol about 2.2.

Calculate the percentage content of C₅H₁₂O₅, taking into account the declared content of *xylitol CRS*, and the percentage content of each related product in the substance to be examined from the expression:

$$100 \times \frac{m_s}{m_u} \times \frac{R_u}{R_s}$$

m_s = mass of the respective component in 1 ml of the reference solution, in milligrams,

m_u = mass of the substance to be examined in 1 ml of the test solution, in milligrams,

R_s = ratio of the surface areas of the derivatised component peak to the derivatised erythritol peak in the chromatogram obtained with the reference solution,

R_u = ratio of the surface areas of the derivatised component peak to the derivatised erythritol peak in the chromatogram obtained with the test solution.

LABELLING

The label states:

- where applicable, the maximum concentration of bacterial endotoxins,
- where applicable, that the substance is suitable for use in the manufacture of parenteral dosage forms.

IMPURITIES

A. *L*-arabinitol,

B. *meso*-galactitol,

C. mannitol,

D. sorbitol.

01/2005:1162

XYLOMETAZOLINE HYDROCHLORIDE**Xylometazolini hydrochloridum** $C_{16}H_{25}ClN_2$ M_r 280.8**DEFINITION**

Xylometazoline hydrochloride contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of 2-[4-(1,1-dimethylethyl)-2,6-dimethylbenzyl]-4,5-dihydro-1H-imidazole hydrochloride, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, freely soluble in water, in alcohol and in methanol.

IDENTIFICATION

First identification: A, E.

Second identification: B, C, D, E.

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *xylometazoline hydrochloride CRS*.
- Examine the chromatograms obtained in the test for related substances. The principal spot in the chromatogram obtained with test solution (b) is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a).
- Dissolve about 0.5 mg in 1 ml of *methanol R* and add 0.5 ml of a freshly prepared 50 g/l solution of *sodium nitroprusside R* and 0.5 ml of a 20 g/l solution of *sodium hydroxide R*. Allow to stand for 10 min and add 1 ml of an 80 g/l solution of *sodium bicarbonate R*. A violet colour develops.
- Dissolve 0.2 g in 1 ml of *water R*, add 2.5 ml of *alcohol R* and 2 ml of 1 M *sodium hydroxide*. Mix thoroughly and examine in ultraviolet light at 365 nm. The solution shows no fluorescence or at most the same fluorescence as a blank solution prepared in the same manner. The identification is not valid unless a solution prepared in the same manner using *naphazoline hydrochloride CRS* instead of the substance to be examined shows a distinct bluish fluorescence.
- It gives reaction (a) of chlorides (2.3.1).

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50.0 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Acidity or alkalinity. Dissolve 0.25 g in *water R* and dilute to 25 ml with the same solvent. Add 0.1 ml of *methyl red solution R* and 0.1 ml of 0.01 M *hydrochloric acid*. The solution is red. Not more than 0.2 ml of 0.01 M *sodium hydroxide* is required to change the colour of the indicator to yellow.

Related substances. Examine by thin-layer chromatography (2.2.27), using *silica gel G R* as the coating substance.

Test solution (a). Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 5 ml with the same solvent.

Test solution (b). Dilute 1 ml of test solution (a) to 10 ml with *methanol R*.

Reference solution (a). Dissolve 20 mg of *xylometazoline hydrochloride CRS* in *methanol R* and dilute to 5 ml with the same solvent.

Reference solution (b). Dissolve 4 mg of *xylometazoline impurity A CRS* in *methanol R* and dilute to 50 ml with the same solvent.

Reference solution (c). Dilute 1 ml of test solution (b) to 50 ml with *methanol R*.

Apply to the plate 5 µl of each solution. Develop over a path of 10 cm using a mixture of 5 volumes of *concentrated ammonia R* and 100 volumes of *methanol R*. Allow the plate to dry. At the bottom of a chromatography tank place an evaporating dish containing a mixture of 1 volume of *water R*, 1 volume of *hydrochloric acid R1* and 2 volumes of a 15 g/l solution of *potassium permanganate R*. Close the tank and allow to stand for 15 min. Place the dried plate in the tank and reclose the tank. Leave the plate in contact with the chlorine vapour for 5 min. Withdraw the plate and place it in a current of cold air until the excess of chlorine is removed and an area of the coating below the points of application does not give a blue colour with a drop of *potassium iodide and starch solution R*. Spray with *potassium iodide and starch solution R*. Any spot in the chromatogram obtained with test solution (a) corresponding to xylometazoline impurity A, is not more intense than the principle spot in the chromatogram obtained with reference solution (b) (0.2 per cent). Any spot in the chromatogram obtained with test solution (a), apart from the principal spot and the spot corresponding to xylometazoline impurity A is not more intense than the principle spot in the chromatogram obtained with reference solution (c) (0.2 per cent).

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.200 g in 25 ml of *anhydrous acetic acid R* and add 10 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M *perchloric acid* is equivalent to 28.08 mg of $C_{16}H_{25}ClN_2$.

STORAGE

Store protected from light.

IMPURITIES

- A. *N*-(2-aminomethyl)-2-[4-(1,1-dimethylethyl)-2,6-dimethylphenyl]acetamide.

01/2005:1278
corrected**XYLOSE****Xylosum** $C_5H_{10}O_5$ M_r 150.1**DEFINITION**

Xylose is (+)-D-xylopyranose.

CHARACTERS

A white or almost white, crystalline powder or colourless needles, freely soluble in water, soluble in hot alcohol.

IDENTIFICATION*First identification: A.**Second identification: B, C.*

- A. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *xylose CRS*. Examine the substances prepared as discs.
- B. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (a). Dissolve 10 mg of *xylose CRS* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Reference solution (b). Dissolve 10 mg of *fructose R*, 10 mg of *glucose R* and 10 mg of *xylose R* in a mixture of 2 volumes of *water R* and 3 volumes of *methanol R* and dilute to 20 ml with the same mixture of solvents.

Apply to the plate 2 µl of each solution and thoroughly dry the starting points. Develop over a path of 15 cm using a mixture of 10 volumes of *water R*, 15 volumes of *methanol R*, 25 volumes of *anhydrous acetic acid R* and 50 volumes of *ethylene chloride R*. The solvents should be measured accurately since a slight excess of water produces cloudiness. Dry the plate in a current of warm air. Spray uniformly with a 5 g/l solution of *thymol R* in a mixture of 5 ml of *sulphuric acid R* and 95 ml of *alcohol R*. Heat in an oven at 130 °C for 10 min. The principal spot in the chromatogram obtained with the test solution is similar in position, colour and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows three clearly separated spots.

- C. Dissolve 0.1 g in 10 ml of *water R*. Add 3 ml of *cupri-tartaric solution R* and heat. An orange to red precipitate is formed.

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

Acidity or alkalinity. To 50 ml of solution S add 0.3 ml of *phenolphthalein solution R1*. The solution is colourless. Not more than 0.2 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator to pink.

Specific optical rotation (2.2.7). Dissolve 10.0 g in 80 ml of *water R*, add 1 ml of *dilute ammonia R2* and dilute to 100.0 ml with *water R*. Allow to stand for 30 min. The specific optical rotation is + 18.5 to + 19.5, calculated with reference to the dried substance.

Chlorides (2.4.4). Dilute 1.5 ml of solution S to 15 ml with *water R*. The solution complies with the limit test for chlorides (330 ppm).

Heavy metals (2.4.8). 12 ml of solution S complies with limit test A for heavy metals (20 ppm). Prepare the standard using *lead standard solution (2 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 0.5 per cent, determined on 1.000 g by drying in an oven at 100-105 °C at a pressure not exceeding 0.7 kPa.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

01/2005:1382

YARROW

Millefolii herba

DEFINITION

Yarrow consists of the whole or cut, dried flowering tops of *Achillea millefolium* L. It contains not less than 2 ml/kg of essential oil and not less than 0.02 per cent of proazulenes, expressed as chamazulene ($C_{14}H_{16}$; M_r 184.3), both calculated with reference to the dried drug.

CHARACTERS

It has the macroscopic and microscopic characters described under identification tests A and B.

IDENTIFICATION

- A. The leaves are green or greyish-green, faintly pubescent on the upper surface and more pubescent on the lower surface, two to three pinnately divided with linear lobes and a finely pointed whitish tip. The capitula are arranged in a corymb at the end of the stem. Each capitulum, 3 mm to 5 mm in diameter, consists of the receptacle, usually four or five ligulate ray-florets and three to twenty tubular disk-florets. The involucre consists of three rows of imbricate lanceolate, pubescent green bracts arranged with a brownish or whitish, membranous margin. The receptacle is slightly convex and, in the axillae of paleae, bears a ligulate ray floret with a three-lobed, whitish or reddish ligule and tubular disk-florets with a radial, five-lobed, yellowish or light brownish corolla. The pubescent green, partly brown or violet stems are longitudinally furrowed, up to 3 mm thick with a light-coloured medulla.
- B. Reduce to a powder (355). The powder is green or greyish-green. Examine under a microscope, using *chloral hydrate solution R*. The powder shows fragments of the stems, leaves and bracts bearing very rare glandular trichomes with a short stalk and a head formed of two rows of three to five cells enclosed in a bladder-like membrane and uniseriate covering trichomes consisting of four to six small, more or less isodiametric cells at the base and a thick-walled, often somewhat tortuous terminal cell, about 400 μ m to greater than 1000 μ m long; fragments of the ligulate corolla with papillary epidermal cells; small-celled parenchyma from the corolla tubes containing cluster crystals of calcium oxalate; groups of lignified and pitted cells from the bracts; spherical pollen grains, about 30 μ m in diameter, with three germinal pores and spiny exine; groups of sclerenchymatous fibres and small vessels with spiral or annular thickening, from the stem.
- C. Add 2.5 ml of *dimethylaminobenzaldehyde solution R8* to 0.1 ml of solution S (see Tests) and heat on a water-bath for 2 min. Allow to cool. Add 5 ml of *light petroleum R* and shake the mixture vigorously. The aqueous layer shows a blue or greenish-blue colour.
- D. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.
- Test solution.** Use the solution prepared in identification test C.
- Reference solution.** Dissolve 10 mg of *cineole R* and 10 mg of *guaiazulene R* in 20 ml of *toluene R*. Apply to the plate as bands 20 μ l of each solution. Develop over a path of 10 cm using a mixture of 5 volumes of *ethyl acetate R* and 95 volumes of *toluene R*. Allow

the plate to dry in air. Spray the plate with *anisaldehyde solution R*. Examine in daylight while heating at 100 °C to 105 °C for 5 min to 10 min. The chromatogram obtained with the reference solution shows in the upper part a red zone (guaiazulene) and in the middle part a blue or greyish-blue zone (cineole). The chromatogram obtained with the test solution shows: a violet zone a little above the zone due to guaiazulene in the chromatogram obtained with the reference solution; below this zone a reddish-violet zone; below which, one or two not clearly separated greyish-violet to greyish zones (which changes to greenish-grey after a few hours) and a reddish-violet zone a little above the zone due to cineole in the chromatogram obtained with the reference solution. Further faint zones are present.

TESTS

Solution S. To 2.0 g of the powdered drug (710) add 25 ml of *ethyl acetate R*, shake for 5 min and filter. Evaporate to dryness on a water-bath and dissolve the residue in 0.5 ml of *toluene R*.

Foreign matter (2.8.2). Not more than 5 per cent of stems, with a diameter greater than 3 mm and not more than 2 per cent of other foreign matter.

Loss on drying (2.2.32). Not more than 12.0 per cent determined on 0.500 g of powdered drug (355) by drying in an oven at 100 °C to 105 °C for 2 h.

Total ash (2.4.16). Not more than 10.0 per cent.

Ash insoluble in hydrochloric acid (2.8.1). Not more than 2.5 per cent.

ASSAY

Essential oil. Carry out the determination of essential oil in vegetable drugs (2.8.12). Use 20.0 g of cut drug, a 1000 ml round-bottomed flask and 500 ml of a mixture of 1 volume of *water R* and 9 volumes of *ethylene glycol R* as the distillation liquid. Add 0.2 ml of *xylene R* in the graduated tube. Distil at a rate of 2 ml/min to 3 ml/min for 2 h.

Stop cooling at the end of distillation and continue distilling until the blue, steam-volatile components have reached the lower end of the cooler. Immediately start cooling again, taking care to avoid warming the separation space. Stop the distillation after 5 min. Replace the 1000 ml round-bottomed flask by a 250 ml round-bottomed flask containing a mixture of 0.4 ml of *xylene R* and 50 ml of *water R*. Distil for 15 min. After 10 min read the total volume. To determine the blank value, use 0.2 ml of *xylene R* in the graduated tube and distil a mixture of 0.4 ml of *xylene R* and 50 ml of *water R* for 15 min.

Proazulenes. To ensure that as little water as possible is transferred, transfer the blue essential oil-xylene mixture obtained in the assay of essential oil to a 50 ml volumetric flask with the aid of small portions of *xylene R*, rinsing the graduated tube of the apparatus with *xylene R* and dilute to 50.0 ml with the same solvent. Measure the absorbance (2.2.25) at 608 nm using *xylene R* as the compensation liquid.

Calculate the percentage content of proazulenes, expressed as chamazulene from the expression:

$$\frac{A \times 2.1}{m}$$

i.e. taking the specific absorbance of chamazulene to be 23.8.

A = absorbance at 608 nm,

m = mass of the drug to be examined in grams.

STORAGE

Store protected from light.

01/2005:1059

ZIDOVUDINE**Zidovudinum** $C_{10}H_{13}N_5O_4$ M_r 267.2**DEFINITION**

Zidovudine contains not less than 97.0 per cent and not more than the equivalent of 102.0 per cent of 1-(3-azido-2,3-dideoxy-β-D-*erythro*-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione, calculated with reference to the dried substance.

CHARACTERS

A white or brownish powder, sparingly soluble in water, soluble in ethanol. It melts at about 124 °C.

It shows polymorphism.

IDENTIFICATION

Examine by infrared absorption spectrophotometry (2.2.24) comparing with the spectrum obtained with *zidovudine CRS*. If the spectra obtained in the solid state show differences, dissolve the substance to be examined and the reference substance separately in the minimum quantity of *water R* and evaporate to dryness in a desiccator, under high vacuum over *diphosphorus pentoxide R*. Record new spectra using the residues.

TESTS

Appearance of solution. Dissolve 0.5 g in 50 ml of *water R*, heating if necessary. The solution is not more intensely coloured than reference solution BY₅ (2.2.2, *Method II*).

Specific optical rotation (2.2.7). Dissolve 0.50 g in *ethanol R* and dilute to 50.0 ml with the same solvent. The specific optical rotation, determined at 25 °C is + 60.5 to + 63.0, calculated with reference to the dried substance.

Related substances

A. Examine by thin-layer chromatography (2.2.27), using a plate coated with a suitable silica gel containing a fluorescent indicator having an optimal intensity at 254 nm.

Test solution. Dissolve 0.20 g of the substance to be examined in *methanol R* and dilute to 10 ml with the same solvent.

Reference solution (a). Dissolve 20 mg each of *thymine R*, *zidovudine impurity A CRS* and *triphenylmethanol R* in *methanol R*, add 1.0 ml of the test solution and dilute to 100 ml with *methanol R*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10 ml with *methanol R*.

Apply separately to the plate 10 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *methanol R* and 90 volumes of *methylene*

chloride R. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. In the chromatogram obtained with the test solution: any spot corresponding to zidovudine impurity A is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.5 per cent), and any spot apart from the principal spot and any spot corresponding to zidovudine impurity A and thymine (which is limited by liquid chromatography) is not more intense than the spot corresponding to zidovudine in the chromatogram obtained with reference solution (b) (0.5 per cent). Spray the plate with a 10 g/l solution of *vanillin R* in *sulphuric acid R*. In the chromatogram obtained with the test solution, any spot corresponding to triphenylmethanol is not more intense than the corresponding spot in the chromatogram obtained with reference solution (b) (0.5 per cent). The test is not valid unless the chromatogram obtained with reference solution (a) shows four clearly separated spots, corresponding to thymine, zidovudine impurity A, zidovudine and triphenylmethanol, in order of increasing R_f value.

B. Examine by liquid chromatography as described in the assay. Inject separately 10 µl each of test solution (a), reference solution (b), reference solution (d) and reference solution (e). Continue the chromatography for 1.5 times the retention time of the principal peak in the chromatogram obtained with test solution (a). When the chromatograms are recorded in the prescribed conditions, the substances are eluted in the following sequence: thymine, zidovudine and zidovudine impurity B. In the chromatogram obtained with test solution (a): the area of any peak corresponding to thymine is not greater than the area of the peak in the chromatogram obtained with reference solution (b) (2 per cent); the area of any peak corresponding to zidovudine impurity B is not greater than the area of the corresponding peak in the chromatogram obtained with reference solution (d) (1 per cent); the area of any other peak apart from the principal peak is not greater than the area of the peak in the chromatogram obtained with reference solution (e) (0.5 per cent). The total surface area of all the peaks apart from the principal peak obtained in the chromatogram with test solution (a) is not greater than six times the area of the peak obtained with reference solution (e) (3.0 per cent). Disregard any peak with an area less than 10 per cent of the area of the peak in the chromatogram obtained with reference solution (e).

Heavy metals (2.4.8). 1.00 g complies with limit test D for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution (10 ppm Pb) R*.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

Sulphated ash (2.4.14). Not more than 0.25 per cent, determined on 1.00 g.

ASSAY

Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 50.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Test solution (b). Dilute 10.0 ml of test solution (a) to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 10.0 mg of *zidovudine CRS* in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (b). Dissolve 10.0 mg of *thymine R* in *methanol R* and dilute to 50.0 ml with the same solvent. Dilute 5.0 ml of the solution to 50.0 ml with the mobile phase.

Reference solution (c). Dissolve 5 mg of *zidovudine impurity B CRS* in 25.0 ml of reference solution (a) and dilute to 50.0 ml with the mobile phase.

Reference solution (d). Dilute 5.0 ml of reference solution (c) to 50.0 ml with the mobile phase.

Reference solution (e). Dilute 0.25 ml of test solution (a) to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture of 20 volumes of *methanol R* and 80 volumes of *water R*,
- as detector a spectrophotometer set at 265 nm.

Equilibrate the column with the mobile phase at a flow rate of 1.2 ml per minute for about 45 min. Inject 10 µl of reference solution (c). Adjust the sensitivity of the detector so that the height of the principal peaks in the chromatogram obtained is not less than 70 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks due to zidovudine and zidovudine impurity B is at least 1.0. Inject separately 10 µl of test solution (b) and 10 µl of reference solution (a). Adjust the sensitivity of the detector so that the height of the peaks in the chromatograms obtained is not less than 50 per cent of the full scale of the recorder.

Calculate the content of $C_{10}H_{13}N_5O_4$ from the areas of the peaks and the declared content of *zidovudine CRS*.

STORAGE

Store protected from light.

IMPURITIES

- A. 1-[(2*R*,5*S*)-5-(hydroxymethyl)-2,5-dihydrofuran-2-yl]-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,

- B. 1-(3-chloro-2,3-dideoxy-β-*D*-erythro-pentofuranosyl)-5-methylpyrimidine-2,4(1*H*,3*H*)-dione,

- C. 5-methylpyrimidine-2,4(1*H*,3*H*)-dione (thymine),

- D. triphenylmethanol.

01/2005:1482

ZINC ACETATE DIHYDRATE

Zinci acetas dihydricus

$C_4H_6O_4Zn \cdot 2H_2O$

M_r 219.5

DEFINITION

Zinc acetate dihydrate contains not less than 99.0 per cent and not more than the equivalent of 101.0 per cent of $C_4H_6O_4Zn \cdot 2H_2O$.

CHARACTERS

A white crystalline powder or leaflets, freely soluble in water, soluble in alcohol.

IDENTIFICATION

- A. It gives reaction (a) of acetate (2.3.1).
B. It gives the reaction of zinc (2.3.1).

TESTS

Solution S. Dissolve 10.0 g in *carbon dioxide-free water R* prepared from *distilled water R* and dilute to 100 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3). Dilute 10 ml of solution S to 20 ml with *carbon dioxide-free water R*. The pH of the solution is 5.8 to 7.0.

Reducing substances. Boil for 5 min a mixture of 10 ml of solution S, 90 ml of *water R*, 5 ml of *dilute sulphuric acid R* and 1.5 ml of a 0.3 g/l solution of *potassium permanganate R*. The pink colour of the solution remains.

Chlorides (2.4.4). 10 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (50 ppm).

Sulphates (2.4.13). 15 ml of solution S complies with the limit test for sulphates (100 ppm).

Aluminium. Not more than 5 ppm of Al, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 2.50 g of the substance to be examined in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *aluminium standard solution (200 ppm Al) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 309.3 nm, using an aluminium hollow-cathode lamp as a source of radiation and an air-acetylene or an acetylene-nitrous oxide flame.

Arsenic (2.4.2). 0.5 g complies with limit test A for arsenic (2 ppm).

Cadmium. Not more than 2 ppm of Cd, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use the solution described in the test for aluminium.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*. Measure the absorbance at 228.8 nm, using a cadmium hollow-cathode lamp as a source of radiation and an air-acetylene flame.

Copper. Not more than 50 ppm of Cu, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Use the solution described in the test for iron.

Reference solutions. Prepare the reference solutions using *copper standard solution (10 ppm Cu) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*. Measure the absorbance at 324.8 nm, using a copper hollow-cathode lamp as source of radiation and an air-acetylene flame.

Iron. Not more than 50 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 1.25 g of the substance to be examined in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acid solution.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 248.3 nm, using an iron hollow-cathode lamp as a source of radiation and an air-acetylene flame.

Lead. Not more than 10 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 5.00 g of the substance to be examined in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acid solution.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent of Pb) R*, diluting with a 200 g/l solution of *cadmium- and lead-free nitric acid R*. Measure the absorbance at 283.3 nm, using a lead hollow-cathode lamp as a source of radiation and an air-acetylene flame.

ASSAY

Dissolve 0.200 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M sodium edetate is equivalent to 21.95 mg of $C_6H_{12}N_2O_6Zn \cdot 2H_2O$.

STORAGE

Store in a non-metallic container.

01/2005:1279

ZINC ACEXAMATE

Zinci acexamas

DEFINITION

Zinc acexamate contains not less than 97.5 per cent and not more than the equivalent of 101.0 per cent of zinc 6-(acetylamino)hexanoate, calculated with reference to the dried substance.

CHARACTERS

A white or almost white, crystalline powder, soluble in water, practically insoluble in acetone and in alcohol. It dissolves in dilute nitric acid.

It melts at about 198 °C.

IDENTIFICATION

- Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *zinc acexamate CRS*. Examine the substances prepared as discs.
- 5 ml of solution S (see Tests) gives the reaction of zinc (2.3.1).

TESTS

Solution S. Dissolve 0.5 g in *carbon dioxide-free water R* and dilute to 20 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension IV (2.2.1) and is colourless (2.2.2, *Method II*).

pH (2.2.3). The pH of solution S is 5.0 to 7.0.

6-Aminohexanoic acid. Examine by thin-layer chromatography (2.2.27), using a suitable silica gel as the coating substance.

Test solution. Dissolve 0.30 g of the substance to be examined in *water R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 15 mg of 6-aminohexanoic acid *R* in *water R* and dilute to 10 ml with the same solvent. Dilute 1 ml of the solution to 10 ml with *water R*.

Apply to the plate 5 µl of the test solution and 5 µl of the reference solution. Allow the plate to dry in air. Develop over a path of 15 cm using a mixture of 2 volumes of *ammonia R*, 30 volumes of *water R* and 68 volumes of *alcohol R*. Dry the plate in a current of warm air. Spray with *ninhydrin solution R* and heat at 100 °C to 105 °C for 15 min. In the chromatogram obtained with the test solution, any spot corresponding to 6-aminohexanoic acid is not more intense than the spot in the chromatogram obtained with the reference solution (0.5 per cent).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution (a). Dissolve 0.50 g of the substance to be examined in *water R* and dilute to 100.0 ml with the same solvent.

Test solution (b). To 20.0 ml of test solution (a), add 20 ml of the mobile phase, 0.4 ml of a 100 g/l solution of *phosphoric acid R* and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 40 mg of *N-acetyl-ε-caprolactam R* in *water R* and dilute to 100.0 ml with the same solvent.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 100.0 ml with *water R*.

Reference solution (c). Dissolve 20 mg of *zinc acexamate impurity A CRS* in *water R* and dilute to 50.0 ml with the same solvent.

Reference solution (d). Dissolve 40 mg of *ε-caprolactam R* in *water R* and dilute to 100.0 ml with the same solvent. Dilute 5.0 ml of the solution to 100.0 ml with *water R*.

Reference solution (e). To 20.0 ml of test solution (a), add 5.0 ml of reference solution (b), 5.0 ml of reference solution (c), 5.0 ml of reference solution (d) and 0.4 ml of a 100 g/l solution of *phosphoric acid R* and dilute to 50.0 ml with the mobile phase.

Reference solution (f). To 5.0 ml of reference solution (c), add 5.0 ml of reference solution (b), 5.0 ml of reference solution (d) and 0.4 ml of a 100 g/l solution of *phosphoric acid R* and dilute to 50.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.0 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
- as mobile phase at a flow rate of 1.2 ml/min a mixture of 0.2 volumes of *phosphoric acid R*, 8 volumes of *acetonitrile R* and 92 volumes of *water R*, adjusted to pH 4.5 with *dilute ammonia R1*,
- as detector a spectrophotometer set at 210 nm.

When the chromatograms are recorded in the prescribed conditions, the elution order is: zinc acexamate, ε-caprolactam, zinc acexamate impurity A and *N*-acetyl-ε-caprolactam. Inject 20 µl of reference solution (e). Continue the chromatography for eight times the retention time of zinc acexamate. Adjust the sensitivity of the system so that the height of the peak corresponding to zinc acexamate impurity A is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the first peak (zinc acexamate) and the second peak (ε-caprolactam) is at least 3.0. If necessary adjust the pH of the mobile phase to 4.7 with *dilute ammonia R1*.

Inject 20 µl of test solution (b) and 20 µl of reference solution (f). In the chromatogram obtained with test solution (b): the area of any peak corresponding to *N*-acetyl-ε-caprolactam is not greater than that of the corresponding peak in the chromatogram obtained with reference solution (f) (0.1 per cent); the area of any peak corresponding to zinc acexamate impurity A is not greater than that of the corresponding peak in the chromatogram obtained with reference solution (f) (2 per cent); the area of any peak corresponding to ε-caprolactam is not greater than that of the corresponding peak in the chromatogram obtained with reference solution (f) (0.1 per cent); the sum of the areas of all the peaks, apart from the principal peak and the peak due to zinc acexamate impurity A is not greater than five times the area of the peak due to *N*-acetyl-ε-caprolactam in the chromatogram obtained with reference solution (f) (0.5 per cent). Disregard any peak with an area less than 0.5 times that of the peak due to *N*-acetyl-ε-caprolactam in the chromatogram obtained with reference solution (f).

Arsenic (2.4.2). 0.5 g complies with limit test A for arsenic (2 ppm).

Cadmium. Not more than 2 ppm of Cd, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 2.50 g of the substance to be examined in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent of Cd) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 228.8 nm, using a cadmium hollow-cathode lamp as a source of radiation and an air-acetylene flame.

Iron. Not more than 50 ppm of Fe, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 1.25 g of the substance to be examined in 20 ml of a 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *iron standard solution (20 ppm Fe) R*, diluted with a 200 g/l solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 248.3 nm, using an iron hollow-cathode lamp as a source of radiation and an air-acetylene flame.

Lead. Not more than 10 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method I*).

Test solution. Dissolve 5.00 g of the substance to be examined in 20 ml of 200 g/l solution of *cadmium- and lead-free nitric acid R* and dilute to 25.0 ml with the same acidic solution.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent of Pb) R*, diluting with a 200 g/l solution of *cadmium- and lead-free nitric acid R*. Measure the absorbance at 283.3 nm, using a lead hollow-cathode lamp as a source of radiation and an air-acetylene flame.

Loss on drying (2.2.32). Not more than 1.0 per cent, determined on 1.000 g by drying in an oven at 100 °C to 105 °C.

ASSAY

Dissolve 0.400 g in 10 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 40.98 mg of C₁₆H₂₈N₂O₆Zn.

STORAGE

Store in a non-metallic container.

IMPURITIES

A. 6-[[6-(acetylamino)hexanoyl]amino]hexanoic acid,

B. 6-aminohexanoic acid (6-aminocaproic acid),

C. R = CO-CH₃: 1-acetylhexahydro-2H-azepin-2-one (*N*-acetyl-ε-caprolactam),

D. R = H: hexahydro-2H-azepin-2-one (ε-caprolactam).

01/2005:0110

ZINC CHLORIDE

Zinci chloridum

ZnCl₂

M_r 136.3

DEFINITION

Zinc chloride contains not less than 95.0 per cent and not more than the equivalent of 100.5 per cent of ZnCl₂.

CHARACTERS

A white, crystalline powder or cast in white sticks, deliquescent, very soluble in water, freely soluble in alcohol and in glycerol.

IDENTIFICATION

- A. Dissolve 0.5 g in *dilute nitric acid R* and dilute to 10 ml with the same acid. The solution gives reaction (a) of chlorides (2.3.1).
- B. 5 ml of solution S (see Tests) gives the reaction of zinc (2.3.1).

TESTS

Solution S. To 2.0 g add 38 ml of *carbon dioxide-free water R* prepared from *distilled water R* and add *dilute hydrochloric acid R* dropwise until dissolution is complete. Dilute to 40 ml with *carbon dioxide-free water R* prepared from *distilled water R*.

pH (2.2.3). Dissolve 1.0 g in 9 ml of *carbon dioxide-free water R*, ignoring any slight turbidity. The pH of the solution is 4.6 to 5.5.

Oxychlorides. Dissolve 1.5 g in 1.5 ml of *carbon dioxide-free water R*. The solution is not more opalescent than reference suspension II (2.2.1). Add 7.5 ml of *alcohol R*. The solution may become cloudy within 10 min. Any cloudiness disappears on the addition of 0.2 ml of *dilute hydrochloric acid R*.

Sulphates (2.4.13). 5 ml of solution S diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (200 ppm). Prepare the standard using a mixture of 5 ml of *sulphate standard solution (10 ppm SO₄) R* and 10 ml of *distilled water R*.

Aluminium, calcium, heavy metals, iron, magnesium. To 8 ml of solution S add 2 ml of *concentrated ammonia R* and shake. The solution is clear (2.2.1) and colourless (2.2.2, *Method II*). Add 1 ml of *disodium hydrogen phosphate solution R*. The solution remains clear for at least 5 min. Add 0.2 ml of *sodium sulphide solution R*. A white precipitate is formed and the supernatant liquid remains colourless.

Ammonium (2.4.1). 0.5 ml of solution S diluted to 15 ml with *water R* complies with the limit test for ammonium (400 ppm).

ASSAY

Dissolve 0.250 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 13.63 mg of ZnCl₂.

STORAGE

Store in a non-metallic container.

CHARACTERS

A soft, white or faintly yellowish-white, amorphous powder, free from gritty particles, practically insoluble in water and in alcohol. It dissolves in dilute mineral acids.

IDENTIFICATION

- A. It becomes yellow when strongly heated; the yellow colour disappears on cooling.
- B. Dissolve 0.1 g in 1.5 ml of *dilute hydrochloric acid R* and dilute to 5 ml with *water R*. The solution gives the reaction of zinc (2.3.1).

TESTS

Alkalinity. Shake 1.0 g with 10 ml of boiling *water R*. Add 0.1 ml of *phenolphthalein solution R* and filter. If the filtrate is red, not more than 0.3 ml of 0.1 M *hydrochloric acid* is required to change the colour of the indicator.

Carbonates and substances insoluble in acids. Dissolve 1.0 g in 15 ml of *dilute hydrochloric acid R*. It dissolves without effervescence and the solution is not more opalescent than reference suspension II (2.2.1) and is colourless (2.2.2, *Method II*).

Arsenic (2.4.2). 0.2 g complies with limit test A for arsenic (5 ppm).

Cadmium. Not more than 10 ppm of Cd, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 2.0 g of the substance to be examined in 14 ml of a mixture of equal volumes of *water R* and *cadmium- and lead-free nitric acid R*, boil for 1 min, cool and dilute to 100.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *cadmium standard solution (0.1 per cent Cd) R* and diluting with a 3.5 per cent V/V solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation and an air-acetylene or an air-propane flame.

Iron (2.4.9). Dissolve 50 mg in 1 ml of *dilute hydrochloric acid R* and dilute to 10 ml with *water R*. The solution complies with the limit test for iron (200 ppm). Use in this test 0.5 ml of *thioglycollic acid R*.

Lead. Not more than 50 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dissolve 5.0 g in 24 ml of a mixture of equal volumes of *water R* and *cadmium- and lead-free nitric acid R*, boil for 1 min, cool and dilute to 100.0 ml with *water R*.

Reference solutions. Prepare the reference solutions using *lead standard solution (0.1 per cent Pb) R* and diluting with a 3.5 per cent V/V solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame. Depending on the apparatus, the line at 217.0 nm may be used.

Loss on ignition. Not more than 1.0 per cent, determined on 1.00 g at 500 °C.

ASSAY

Dissolve 0.150 g in 10 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 8.14 mg of ZnO.

01/2005:0252

ZINC OXIDE

Zinci oxidum

ZnO

M_r 81.4

DEFINITION

Zinc oxide contains not less than 99.0 per cent and not more than the equivalent of 100.5 per cent of ZnO, calculated with reference to the ignited substance.

01/2005:0306

ZINC STEARATE**Zinci stearas****DEFINITION**

Zinc stearate $[(C_{17}H_{35}COO)_2Zn; M_r 632]$ may contain varying proportions of zinc palmitate $[(C_{15}H_{31}COO)_2Zn; M_r 576.2]$ and zinc oleate $[(C_{17}H_{33}COO)_2Zn; M_r 628]$. It contains not less than 10.0 per cent and not more than 12.0 per cent of Zn.

CHARACTERS

A light, white, amorphous powder, free from gritty particles, practically insoluble in water and in ethanol.

IDENTIFICATION

- The residue obtained in the preparation of solution S (see Tests) has a freezing point (2.2.18) not lower than 53 °C.
- Neutralise 5 ml of solution S to *red litmus paper R* with *strong sodium hydroxide solution R*. The solution gives the reaction of zinc (2.3.1).

TESTS

Solution S. To 5.0 g add 50 ml of *ether R* and 40 ml of a 7.5 per cent V/V solution of *cadmium- and lead-free nitric acid R* in *distilled water R*. Heat under a reflux condenser until dissolution is complete. Allow to cool. In a separating funnel, separate the aqueous layer and shake the ether layer with two quantities, each of 4 ml, of *distilled water R*. Combine the aqueous layers, wash with 15 ml of *ether R* and heat on a water-bath until ether is completely eliminated. Allow to cool and dilute to 50.0 ml with *distilled water R* (solution S). Evaporate the ether layer to dryness and dry the residue at 105 °C.

Appearance of solution. Solution S is not more intensely coloured than reference solution Y_6 (2.2.2, *Method II*).

Appearance of solution of fatty acids. Dissolve 0.5 g of the residue obtained in the preparation of solution S in 10 ml of *chloroform R*. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y_5 (2.2.2, *Method II*).

Acidity or alkalinity. Shake 1.0 g with 5 ml of *alcohol R* and add 20 ml of *carbon dioxide-free water R* and 0.1 ml of *phenol red solution R*. Not more than 0.3 ml of 0.1 M *hydrochloric acid* or 0.1 ml of 0.1 M *sodium hydroxide* is required to change the colour of the indicator.

Acid value of the fatty acids (2.5.1). 195 to 210, determined on 0.20 g of the residue obtained in the preparation of solution S, dissolved in 25 ml of the prescribed mixture of solvents.

Chlorides (2.4.4). 2 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides (250 ppm).

Sulphates (2.4.13). Dilute 1 ml of solution S to 50 ml with *distilled water R*. 12.5 ml of the solution diluted to 15 ml with *distilled water R* complies with the limit test for sulphates (0.6 per cent).

Cadmium. Not more than 5 ppm of Cd, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Dilute 20.0 ml of solution S to 50.0 ml with a 3.5 per cent V/V solution of *cadmium- and lead-free nitric acid R*.

Reference solutions. Prepare the reference solutions using *cadmium standard solution* (0.1 per cent Cd) *R* and diluting with a 3.5 per cent V/V solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 228.8 nm using a cadmium hollow-cathode lamp as source of radiation and an air-acetylene or an air-propane flame.

Lead. Not more than 25 ppm of Pb, determined by atomic absorption spectrometry (2.2.23, *Method II*).

Test solution. Use solution S.

Reference solutions. Prepare the reference solutions using *lead standard solution* (0.1 per cent Pb) *R* and diluting with a 3.5 per cent V/V solution of *cadmium- and lead-free nitric acid R*.

Measure the absorbance at 283.3 nm using a lead hollow-cathode lamp as source of radiation and an air-acetylene flame. Depending on the apparatus the line at 217.0 nm may be used.

ASSAY

To 1.000 g add 50 ml of *dilute acetic acid R* and boil for at least 10 min or until the layer of fatty acids is clear, adding more *water R* as necessary to maintain the original volume. Cool and filter. Wash the filter and the flask with *water R* until the washings are no longer acid to *blue litmus paper R*. Combine the filtrate and washings. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M *sodium edetate* is equivalent to 6.54 mg of Zn.

01/2005:0111

ZINC SULPHATE HEPTAHYDRATE**Zinci sulfas heptahydricus** $ZnSO_4 \cdot 7H_2O$ M_r 287.5**DEFINITION**

Content: 99.0 per cent to 104.0 per cent.

CHARACTERS

Appearance: white, crystalline powder or colourless, transparent crystals, efflorescent.

Solubility: very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) gives the reactions of sulphates (2.3.1).
- Solution S gives the reaction of zinc (2.3.1).
- It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in *carbon dioxide-free water R* and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, *Method II*).

pH (2.2.3): 4.4 to 5.6 for solution S.

Chlorides (2.4.4): maximum 300 ppm.

3.3 ml of solution S diluted to 15 ml with *water R* complies with the limit test for chlorides.

Iron (2.4.9): maximum 100 ppm.

2 ml of solution S diluted to 10 ml with *water R* complies with the limit test for iron. Use in this test 0.5 ml of *thioglycollic acid R*.

ASSAY

Dissolve 0.200 g in 5 ml of *dilute acetic acid R*. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M sodium edetate is equivalent to 28.75 mg of $\text{ZnSO}_4 \cdot 7\text{H}_2\text{O}$.

STORAGE

In a non-metallic, airtight container.

01/2005:1683

ZINC SULPHATE HEXAHYDRATE

Zinci sulfas hexahydricus

$\text{ZnSO}_4 \cdot 6\text{H}_2\text{O}$

M_r 269.5

DEFINITION

Content: 99.0 per cent to 104.0 per cent.

CHARACTERS

Appearance: white, crystalline powder or colourless transparent crystals, efflorescent.

Solubility: very soluble in water, practically insoluble in alcohol.

IDENTIFICATION

- Solution S (see Tests) gives the reactions of sulphates (2.3.1).
- Solution S gives the reaction of zinc (2.3.1).
- It complies with the limits of the assay.

TESTS

Solution S. Dissolve 2.5 g in carbon dioxide-free water R and dilute to 50 ml with the same solvent.

Appearance of solution. Solution S is clear (2.2.1) and colourless (2.2.2, Method II).

pH (2.2.3): 4.4 to 5.6 for solution S.

Chlorides (2.4.4): maximum 300 ppm.

3.3 ml of solution S diluted to 15 ml with water R complies with the limit test for chlorides.

Iron (2.4.9): maximum 100 ppm.

2 ml of solution S diluted to 10 ml with water R complies with the limit test for iron. Use in this test 0.5 ml of thioglycollic acid R.

ASSAY

Dissolve 0.200 g in 5 ml of dilute acetic acid R. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M sodium edetate is equivalent to 26.95 mg of $\text{ZnSO}_4 \cdot 6\text{H}_2\text{O}$.

STORAGE

In a non-metallic, airtight container.

DEFINITION

Zinc undecylenate contains not less than 98.0 per cent and not more than the equivalent of 102.0 per cent of zinc di(undec-10-enoate), calculated with reference to the dried substance.

CHARACTERS

A white or almost white, fine powder, practically insoluble in water and in alcohol.

It melts at 116 °C to 121 °C but may leave a slight solid residue.

IDENTIFICATION

- To 2.5 g add 10 ml of water R and 10 ml of dilute sulphuric acid R. Shake with two quantities, each of 10 ml, of ether R. Reserve the aqueous layer for identification test C. Wash the combined ether layers with water R and evaporate to dryness. To the residue add 2 ml of freshly distilled aniline R and boil under a reflux condenser for 10 min. Allow to cool and add 30 ml of ether R. Shake with three quantities, each of 20 ml, of dilute hydrochloric acid R and then with 20 ml of water R. Evaporate the organic layer to dryness on a water-bath. The residue, after recrystallisation twice from alcohol (70 per cent V/V) R and drying *in vacuo* for 3 h, melts (2.2.14) at 66 °C to 68 °C.
- Dissolve 0.1 g in a mixture of 2 ml of dilute sulphuric acid R and 5 ml of glacial acetic acid R. Add dropwise 0.25 ml of potassium permanganate solution R. The colour of the potassium permanganate is discharged.
- A mixture of 1 ml of the aqueous layer obtained in identification test A and 4 ml of water R gives the reaction of zinc (2.3.1).

TESTS

Alkalinity. Mix 1.0 g with 5 ml of alcohol R and 0.5 ml of phenol red solution R. Add 50 ml of carbon dioxide-free water R and examine immediately. No reddish colour appears.

Alkali and alkaline-earth metals. To 1.0 g add 25 ml of water R and 5 ml of hydrochloric acid R and heat to boiling. Filter whilst hot. Wash the filter and the residue with 25 ml of hot water R. Combine the filtrate and washings and add concentrated ammonia R until alkaline. Add 7.5 ml of thioacetamide solution R and heat on a water-bath for 30 min. Filter and wash the precipitate with two quantities, each of 10 ml, of water R. Combine the filtrate and washings, evaporate to dryness on a water-bath and ignite. The residue weighs not more than 20 mg (2 per cent).

Sulphates (2.4.13). To 0.1 g add a mixture of 2 ml of dilute hydrochloric acid R and 10 ml of distilled water R and heat to boiling. Cool, filter and dilute to 15 ml with distilled water R. The solution complies with the limit test for sulphates (500 ppm). Prepare the standard using 5 ml of sulphate standard solution (10 ppm SO_4) R and 10 ml of distilled water R.

Loss on drying (2.2.32). Not more than 1.5 per cent, determined on 0.500 g by drying in an oven at 100 °C to 105 °C.

Degree of unsaturation. Dissolve 0.100 g in a mixture of 5 ml of dilute hydrochloric acid R and 30 ml of glacial acetic acid R. Using 0.05 ml indigo carmine solution R1, added towards the end of the titration as indicator. Titrate with 0.0167 M bromide-bromate until the colour changes from blue to yellow. 9.1 ml to 9.4 ml of 0.0167 M bromide-bromate is required. Carry out a blank titration.

01/2005:0539

ZINC UNDECYLENATE

Zinci undecylenas

$\text{C}_{22}\text{H}_{38}\text{O}_4\text{Zn}$

M_r 431.9

ASSAY

To 0.350 g add 25 ml of *dilute acetic acid R* and heat to boiling. Carry out the complexometric titration of zinc (2.5.11).

1 ml of 0.1 M sodium edetate is equivalent to 43.19 mg of $C_{22}H_{38}O_4Zn$.

STORAGE

Store protected from light.

01/2005:1280

ZOLPIDEM TARTRATE

Zolpidemi tartras

 $C_{42}H_{48}N_6O_8$ M_r 765

DEFINITION

Zolpidem tartrate contains not less than 98.5 per cent and not more than the equivalent of 101.0 per cent of bis[*N,N*-dimethyl-2-[6-methyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridin-3-yl]acetamide] (2*R*,3*R*)-2,3-dihydroxybutanedioate, calculated with reference to the anhydrous substance.

CHARACTERS

A white or almost white, crystalline powder, hygroscopic, slightly soluble in water, sparingly soluble in methanol, practically insoluble in methylene chloride.

IDENTIFICATION

First identification: A, C.

Second identification: B, C.

A. Dissolve 0.10 g in 10 ml of 0.1 M hydrochloric acid. Add 10 ml of *water R*. Add dropwise with stirring 1 ml of *dilute ammonia R2*. Filter and collect the resulting precipitate. Wash the precipitate with *water R* and then dry at 100–105 °C for 2 h (test precipitate). Carry out the same operation using *zolpidem tartrate CRS* (reference precipitate). Examine the precipitates by infrared absorption spectrophotometry (2.2.24) comparing the spectra obtained. Examine the precipitates as discs.

B. Examine by thin-layer chromatography (2.2.27), using a *TLC silica gel F₂₅₄ plate R*.

Test solution. Dissolve 50 mg of the substance to be examined in 5 ml of *methanol R*, add 0.1 ml of *diethylamine R* and dilute to 10 ml with *methanol R*.

Reference solution (a). Dissolve 50 mg of *zolpidem tartrate CRS* in 5 ml of *methanol R*, add 0.1 ml of *diethylamine R* and dilute to 10 ml with *methanol R*.

Reference solution (b). Dissolve 50 mg of *flunitrazepam CRS* in 5 ml of *methylene chloride R* and dilute to 10 ml with the same solvent. Mix 1 ml of the solution with 1 ml of reference solution (a).

Apply to the plate 5 µl of each solution. Develop over a path of 12 cm using a mixture of 10 volumes of *diethylamine R*, 45 volumes of *cyclohexane R* and 45 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with reference solution (a). The test is not valid unless the chromatogram obtained with reference solution (b) shows 2 clearly separated spots.

C. Dissolve about 0.1 g in 1 ml of *methanol R* heating gently. 0.1 ml of the solution gives reaction (b) of tartrates (2.3.1).

TESTS

Appearance of solution. Prepare the solutions protected from light and carry out the test as rapidly as possible. Triturate 0.25 g with 0.125 g of *tartaric acid R*. Dissolve the mixture in 20 ml of *water R* and dilute to 25 ml with the same solvent. The solution is clear (2.2.1) and not more intensely coloured than reference solution Y₆ or BY₆ (2.2.2, Method II).

Related substances. Examine by liquid chromatography (2.2.29).

Test solution. Dissolve 25.0 mg of the substance to be examined in the mobile phase and dilute to 50.0 ml with the mobile phase.

Reference solution (a). Dissolve 5 mg of *zolpidem impurity A CRS* in the mobile phase and dilute to 50 ml with the mobile phase.

Reference solution (b). Dissolve 5 mg of the substance to be examined in the mobile phase and dilute to 50 ml with the mobile phase. To 10 ml of the solution, add 10 ml of reference solution (a).

Reference solution (c). Dilute 2.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of the solution to 10.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.15 m long and 3.9 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (4 µm),
- as mobile phase at a flow rate of 1.5 ml/min a mixture of 18 volumes of *acetonitrile R*, 23 volumes of *methanol R* and 59 volumes of a 5.6 g/l solution of *phosphoric acid R* adjusted to pH 5.5 with *triethylamine R*,
- as detector a spectrophotometer set at 254 nm.

Inject 20 µl of reference solution (b). Adjust the sensitivity of the system so that the height of the peak due to zolpidem impurity A is at least 50 per cent of the full scale of the recorder. The test is not valid unless the resolution between the peaks due to zolpidem impurity A and zolpidem tartrate is at least 2.0.

Inject 20 µl of the test solution and 20 µl of reference solution (c). In the chromatogram obtained with the test solution, the sum of the areas of any peaks, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (c) (0.2 per cent). Disregard any peak with an area less than 0.1 times that of the principal peak in the chromatogram obtained with reference solution (c) and any peak (with a relative retention time of 0.16 to the zolpidem peak) corresponding to tartaric acid.

Water (2.5.12). Not more than 3.0 per cent, determined on 0.50 g by the semi-micro determination of water.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 20 ml of *anhydrous acetic acid R* and 20 ml of *acetic anhydride R*. Titrate with 0.1 M *perchloric acid*, determining the end-point potentiometrically (2.2.20). Carry out a blank titration. 1 ml of 0.1 M *perchloric acid* is equivalent to 38.24 mg of $C_{42}H_{48}N_6O_8$.

STORAGE

Store in an airtight container, protected from light.

IMPURITIES

- A. *N,N*-dimethyl-2-[7-methyl-2-(4-methylphenyl)imidazo[1,2-*a*]pyridin-3-yl]acetamide.

01/2005:1060
corrected

ZOPICLONE

Zopiclonum

and enantiomer

$C_{17}H_{17}ClN_6O_3$

M_r 388.8

DEFINITION

Zopiclone contains not less than 98.5 per cent and not more than the equivalent of 100.5 per cent of (5*RS*)-6-(5-chloropyridin-2-yl)-7-oxo-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-yl 4-methylpiperazine-1-carboxylate, calculated with reference to the solvent-free substance.

CHARACTERS

A white or slightly yellowish powder, practically insoluble in water, freely soluble in methylene chloride, sparingly soluble in acetone, practically insoluble in alcohol. It dissolves in dilute mineral acids.

It melts at about 177 °C, with decomposition.

IDENTIFICATION

First identification: B.

Second identification: A, C.

- A. Dissolve 50.0 mg in a 3.5 g/l solution of *hydrochloric acid R* and dilute to 100.0 ml with the same solvent. Dilute 2.0 ml of this solution to 100.0 ml with a 3.5 g/l solution of *hydrochloric acid R*. Examined between 220 nm and 350 nm (2.2.25), the solution shows an absorption maximum at 303 nm. The specific absorbance at the maximum is 340 to 380.

- B. Examine by infrared absorption spectrophotometry (2.2.24), comparing with the spectrum obtained with *zopiclone CRS*. Examine the substances prepared as discs.

- C. Examine by thin-layer chromatography (2.2.27), using *silica gel GF₂₅₄ R* as the coating substance.

Test solution. Dissolve 10 mg of the substance to be examined in *methylene chloride R* and dilute to 10 ml with the same solvent.

Reference solution. Dissolve 10 mg of *zopiclone CRS* in *methylene chloride R* and dilute to 10 ml with the same solvent.

Apply to the plate 10 µl of each solution. Develop over a path of 15 cm using a mixture of 2 volumes of *triethylamine R*, 50 volumes of *acetone R* and 50 volumes of *ethyl acetate R*. Allow the plate to dry in air and examine in ultraviolet light at 254 nm. The principal spot in the chromatogram obtained with the test solution is similar in position and size to the principal spot in the chromatogram obtained with the reference solution.

TESTS

Solution S. Dissolve 1.0 g in *dimethylformamide R* and dilute to 20.0 ml with the same solvent.

Appearance of solution. Solution S is not more opalescent than reference suspension II (2.2.1) and not more intensely coloured than intensity 5 of the range of reference solutions of the most appropriate colour (2.2.2, *Method II*).

Optical rotation (2.2.7). Dilute 10.0 ml of solution S to 50.0 ml with *dimethylformamide R*. The angle of optical rotation is -0.05° to $+0.05^\circ$.

Related substances. Examine by liquid chromatography (2.2.29). *Prepare the solutions immediately before use.*

Test solution. Dissolve 40.0 mg of the substance to be examined in the mobile phase and dilute to 10.0 ml with the mobile phase.

Reference solution (a). Dilute 3.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (b). Dilute 1.0 ml of the test solution to 100.0 ml with the mobile phase. Dilute 1.0 ml of this solution to 10.0 ml with the mobile phase.

Reference solution (c). Dissolve 4.0 mg of *zopiclone oxide CRS* in the mobile phase and dilute to 10.0 ml with the mobile phase. To 10.0 ml of this solution, add 1.0 ml of the test solution and dilute to 100.0 ml with the mobile phase.

The chromatographic procedure may be carried out using:

- a stainless steel column 0.25 m long and 4.6 mm in internal diameter packed with *octadecylsilyl silica gel for chromatography R* (5 µm),
 - as mobile phase at a flow rate of 1.5 ml/min a mixture of 38 volumes of *acetonitrile R* and 62 volumes of a solution containing 8.1 g/l of *sodium laurilsulfate R* and 1.6 g/l of *sodium dihydrogen phosphate R* adjusted to pH 3.5 with a 10 per cent V/V solution of *phosphoric acid R*,
 - as detector a spectrophotometer set at 303 nm, maintaining the temperature of the column at 30 °C.
- Inject 20 µl of reference solution (c). Adjust the sensitivity of the system so that the height of each of the 2 principal peaks in the chromatogram obtained is at least 30 per cent of the full scale of the recorder. When the chromatograms are recorded in the prescribed conditions, the retention time of zopiclone is 27 min to 31 min. If necessary, adjust the concentration of acetonitrile in the mobile phase (increasing the concentration decreases the retention times and

decreasing the concentration increases the retention times). The test is not valid unless, in the chromatogram obtained with reference solution (c), the resolution between the peaks due to zopiclone oxide and zopiclone is at least 3.0. If the prescribed resolution is not obtained, adjust the mobile phase to pH 4.0 with a 10 per cent *V/V* solution of *phosphoric acid R*.

Inject 20 µl of the test solution, 20 µl of reference solution (a) and 20 µl of reference solution (b). Continue the chromatography for 1.5 times the retention time of zopiclone. In the chromatogram obtained with the test solution: the area of any peak, apart from the principal peak, is not greater than the area of the principal peak in the chromatogram obtained with reference solution (a) (0.3 per cent) and not more than 2 such peaks have an area greater than the area of the principal peak in the chromatogram obtained with reference solution (b) (0.1 per cent).

2-Propanol. Not more than 0.7 per cent *m/m* of 2-propanol, determined by gas chromatography (2.2.28) using *ethanol R1* as the internal standard.

Internal standard solution. Dilute 5 ml of *ethanol R1* to 100 ml with *ethylene chloride R*. Dilute 1 ml of this solution to 10 ml with *ethylene chloride R*.

Test solution. Dissolve 0.25 g of the substance to be examined in *ethylene chloride R*, add 0.5 ml of the internal standard solution and dilute to 5.0 ml with *ethylene chloride R*.

Reference solution. Dilute 4.5 ml of 2-propanol *R* to 100.0 ml with *ethylene chloride R*. To 1.0 ml of this solution, add 10.0 ml of the internal standard solution and dilute to 100.0 ml with *ethylene chloride R*.

The chromatographic procedure may be carried out using:

- a fused-silica column 10 m long and about 0.53 mm in internal diameter with a 20 µm coating of *styrene-divinylbenzene copolymer R*,
- *helium for chromatography R* as the carrier gas at a flow rate of 4 ml/min,
- a flame-ionisation detector,

with the following temperature programme:

	Time (min)	Temperature (°C)	Rate (°C/min)	Comment
Column	0 - 5	50		isothermal
	5 - 10	50 → 70	4	linear gradient
	10 - 14	70		isothermal
	14 - 20.5	70 → 200	20	linear gradient
	20.5 - 27.5	200		isothermal
Injection port		150		
Detector		250		

Inject 1 µl of the test solution and 1 µl of the reference solution. Calculate the percentage content *m/m* of 2-propanol taking its density to be 0.785 g/ml at 20 °C.

Heavy metals (2.4.8). 1.0 g complies with limit test C for heavy metals (20 ppm). Prepare the standard using 2 ml of *lead standard solution* (10 ppm *Pb*) *R*.

Sulphated ash (2.4.14). Not more than 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.300 g in a mixture of 10 ml of *anhydrous acetic acid R* and 40 ml of *acetic anhydride R*. Titrate with 0.1 *M perchloric acid*, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 *M perchloric acid* is equivalent to 38.88 mg of $C_{17}H_{17}ClN_6O_3$.

STORAGE

Store protected from light.

IMPURITIES

- A. (5*RS*)-6-(5-chloropyridin-2-yl)-7-oxo-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-yl 4-methylpiperazine-1-carboxylate 4-oxide (zopiclone oxide),
- B. R-OH and enantiomer: (7*RS*)-6-(5-chloropyridin-2-yl)-7-hydroxy-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-one,
- C. R-H: 6-(5-chloropyridin-2-yl)-6,7-dihydro-5*H*-pyrrolo[3,4-*b*]pyrazin-5-one.

01/2005:1707

ZUCLOPENTHIXOL DECANOATE

Zuclopenthixoli decanoas

$C_{32}H_{43}ClN_2O_2S$

M_r 555.2

DEFINITION

2-[4-[3-[(*Z*)-2-chloro-9*H*-thioxanthen-9-ylidene]propyl]piperazin-1-yl]ethyl decanoate.

Content: 98.0 per cent to 102.0 per cent (dried substance).

CHARACTERS

Appearance: yellow, viscous oily liquid.

Solubility: very slightly soluble in water, very soluble in alcohol and in methylene chloride.

IDENTIFICATION

Infrared absorption spectrophotometry (2.2.24).

Comparison: *Ph. Eur. reference spectrum of zuclopenthixol decanoate.*

TESTS

Appearance of solution. The solution is clear (2.2.1).

Using an ultrasonic bath, dissolve 1.0 g in *alcohol R* and dilute to 20.0 ml with the same solvent.

Related substances. Thin-layer chromatography (2.2.27). Carry out the test protected from light and prepare the solutions immediately before use.

Test solution. Dissolve 0.250 g of the substance to be examined in *alcohol R*, using an ultrasonic bath, and dilute to 100.0 ml with the same solvent.

Reference solution (a). Dilute 1.0 ml of the test solution to 100.0 ml with *alcohol R*. Dilute 1.0 ml of this solution to 10.0 ml with *alcohol R*.

Reference solution (b). Dilute 5.0 ml of reference solution (a) to 10.0 ml with *alcohol R*.

Reference solution (c). Dissolve 5.0 mg of *zuclopenthixol impurity B CRS* in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 10.0 ml of the solution to 100.0 ml with *alcohol R*.

Reference solution (d). Dissolve 5.0 mg of *zuclopenthixol impurity C CRS* in *alcohol R* and dilute to 100.0 ml with the same solvent. Dilute 2.5 ml of the solution to 20.0 ml with *alcohol R*.

Reference solution (e). Dissolve 5.0 mg of *zuclopenthixol impurity B CRS* and 20.0 mg of the substance to be examined in *alcohol R* and dilute to 100.0 ml with the same solvent.

Plate: TLC silica gel plate *R*.

Mobile phase: diethylamine *R*, propanol *R*, cyclohexane *R* (3:10:90 V/V/V).

Application: 4 µl.

Development: horizontally, over 2/3 of the plate.

Drying: in air.

Detection: spray with a 14 per cent V/V alcoholic solution of sulphuric acid *R* prepared immediately before use; heat at 110 °C for 5 min and examine in ultraviolet light at 365 nm.

System suitability: the chromatogram obtained with reference solution (e) shows 2 clearly separated spots.

Limits:

- **impurity B:** any spot corresponding to impurity B is not more intense than the spot in the chromatogram obtained with reference solution (c) (0.2 per cent),
- **impurity C:** any spot corresponding to impurity C is not more intense than the spot in the chromatogram obtained with reference solution (d) (0.25 per cent),
- **any other impurity:** any spots, apart from the principal spot and any spot corresponding to impurity B or impurity C, are not more intense than the spot in the chromatogram obtained with reference solution (a) (0.1 per cent) and at most 3 such spots are more intense than the spot in the chromatogram obtained with reference solution (b) (0.05 per cent).

Impurity A. Liquid chromatography (2.2.29). Carry out the test protected from light and prepare the solutions immediately before use.

Test solution. Dissolve 40.0 mg of the substance to be examined in *alcohol R* and dilute to 100.0 ml with the same solvent.

Reference solution. Dissolve a quantity of *zuclopenthixol impurity A CRS* corresponding to 5.0 mg of impurity A in *alcohol R* and dilute to 100.0 ml with the same solvent. To 5.0 ml of the solution add 0.6 ml of test solution and dilute to 50.0 ml with *alcohol R*.

Column:

- **size:** $l = 0.15$ m, $\varnothing = 4.6$ mm,
- **stationary phase:** octadecylsilyl silica gel for chromatography *R* (5 µm),
- **temperature:** 40 °C.

Mobile phase: mix 25 volumes of a 8.9 g/l solution of docusate sodium *R* and 75 volumes of *alcohol R*; add 0.1 per cent V/V of phosphoric acid *R*.

Flow rate: 1 ml/min.

Detection: spectrophotometer at 230 nm.

Equilibration: at least 1 h with the mobile phase.

Injection: 20 µl.

System suitability: reference solution:

- **resolution:** minimum of 1.5 between the peaks due to zuclopenthixol decanoate (1st peak) and to impurity A (2nd peak).

Limit:

- **impurity A:** not more than the area of the corresponding peak in the chromatogram obtained with reference solution (1.25 per cent).

Heavy metals (2.4.8): maximum 20 ppm.

1.0 g complies with limit test C. Prepare the standard using 2 ml of lead standard solution (10 ppm Pb) *R*.

Loss on drying (2.2.32): maximum 0.5 per cent, determined on 1.000 g by drying in an oven at 60 °C at a pressure not exceeding 0.7 kPa for 3 h.

Sulphated ash (2.4.14): maximum 0.1 per cent, determined on 1.0 g.

ASSAY

Dissolve 0.250 g in 50 ml of *anhydrous acetic acid R*. Titrate with 0.1 M perchloric acid, determining the end-point potentiometrically (2.2.20).

1 ml of 0.1 M perchloric acid is equivalent to 27.76 mg of $C_{32}H_{43}ClN_2O_2S$.

STORAGE

Under an inert gas in an airtight container, protected from light, at a temperature not exceeding –20 °C.

IMPURITIES

A. 2-[4-[3-[(*E*)-2-chloro-9*H*-thioxanthen-9-ylidene]propyl]piperazin-1-yl]ethyl decanoate,

B. 2-chloro-9*H*-thioxanthen-9-one,

C. 2-[4-[3-[(*Z*)-2-chloro-9*H*-thioxanthen-9-ylidene]propyl]piperazin-1-yl]ethanol.

<i>Furosemidum</i>	1644	<i>Glucosum liquidum</i>	1667
Furunculosis vaccine (inactivated, oil-adjuvanted, injectable) for salmonids	767	<i>Glucosum liquidum dispersione desiccatum</i>	1668
Fusidic acid	1645	<i>Glucosum monohydricum</i>	1669
G		Glutamic acid	1670
Galactose	1649	Glycerol	1671
<i>Galactosum</i>	1649	Glycerol (85 per cent)	1672
Gallamine triethiodide	1649	Glycerol dibehenate	1673
<i>Gallamini triethiodidum</i>	1649	Glycerol distearate	1674
<i>Gallii</i> (⁶⁷ Ga) <i>citratissolutio iniectionabilis</i>	826	<i>Glyceroli dibehenas</i>	1673
Gallium (⁶⁷ Ga) citrate injection	826	<i>Glyceroli distearas</i>	1674
Gargles	612	<i>Glyceroli monolinoleas</i>	1675
Garlic for homoeopathic preparations	897	<i>Glyceroli mono-oleates</i>	1676
Garlic powder	1651	<i>Glyceroli monostearas 40-55</i>	1677
Gas chromatography (2.2.28.)	42	<i>Glyceroli trinitratissolutio</i>	1678
Gas detector tubes (2.1.6.)	19	Glycerol monolinoleate	1675
Gases, carbon dioxide in (2.5.24.)	134	Glycerol mono-oleates	1676
Gases, carbon monoxide in (2.5.25.)	134	Glycerol monostearate 40-55	1677
Gases, nitrogen monoxide and nitrogen dioxide in (2.5.26.)	135	Glycerol triacetate	2612
Gases, nitrous oxide in (2.5.35.)	141	<i>Glycerolum</i>	1671
Gases, oxygen in (2.5.27.)	136	<i>Glycerolum (85 per centum)</i>	1672
Gases, water in (2.5.28.)	136	Glyceryl trinitrate solution	1678
Gas-gangrene antitoxin, mixed	802	Glycine	1680
Gas-gangrene antitoxin (novyi)	802	<i>Glycinum</i>	1680
Gas-gangrene antitoxin (perfringens)	803	Glycyrrhizate ammonium	987
Gas-gangrene antitoxin (septicum)	804	Goldenrod	1680
Gastro-resistant capsules	600	Goldenrod, European	1682
Gastro-resistant granules	606	Goldenseal rhizome	1683
Gastro-resistant tablets	628	Gonadorelin acetate	1684
Gelatin	1651	<i>Gonadorelini acetas</i>	1684
<i>Gelatina</i>	1651	Gonadotrophin, chorionic	1686
Gels	625	Gonadotrophin, equine serum, for veterinary use	1686
General chapters (1.3.)	6	<i>Gonadotropinum chorionicum</i>	1686
General notices (1.)	5	<i>Gonadotropinum sericum equinum ad usum veterinarium</i>	1686
General statements (1.1.)	5	Goserelin	1687
General texts on sterility (5.1.)	445	<i>Goserelinum</i>	1687
General texts on vaccines (5.2.)	453	<i>Gossypii oleum hydrogenatum</i>	1370
<i>Gentamicini sulfas</i>	1653	Gramicidin	1689
Gentamicin sulphate	1653	<i>Gramicidinum</i>	1689
<i>Gentianae radix</i>	1654	<i>Graminis rhizoma</i>	1371
<i>Gentianae tinctura</i>	1655	<i>Granulata</i>	605
Gentian root	1654	Granules	605
Gentian tincture	1655	Granules, coated	606
Ginger	1656	Granules, effervescent	606
Gingival solutions	612	Granules, gastro-resistant	606
<i>Ginkgo folium</i>	1657	Granules, modified-release	606
Ginkgo leaf	1657	Greater celandine	1690
Ginseng	1658	Griseofulvin	1691
<i>Ginseng radix</i>	1658	<i>Griseofulvinum</i>	1691
Glass containers for pharmaceutical use (3.2.1.)	303	Guaifenesin	1692
Glibenclamide	1659	<i>Guaifenesinum</i>	1692
<i>Glibenclamidum</i>	1659	Guanethidine monosulphate	1694
Gliclazide	1660	<i>Guanethidini monosulfas</i>	1694
<i>Gliclazidum</i>	1660	Guar	1694
Glipizide	1662	Guar galactomannan	1695
<i>Glipizidum</i>	1662	<i>Guar galactomannanum</i>	1695
Glossary (dosage forms)	599	H	
Glucagon	1663	Haemodiafiltration and for haemofiltration, solutions for	1703
Glucagon, human	1665	Haemodialysis, concentrated solutions for	1700
<i>Glucagonum</i>	1663	Haemodialysis solutions, concentrated, water for diluting	1699

Haemodialysis, solutions for.....	1700	<i>Hexamidini diisetionas</i>	1720
Haemofiltration and for haemodiafiltration, solutions for	1703	Hexetidine.....	1721
Haemophilus type b (conjugate), diphtheria, tetanus, pertussis (acellular, component) and poliomyelitis (inactivated) vaccine (adsorbed)	653	<i>Hexetidinum</i>	1721
Haemophilus type b (conjugate), diphtheria, tetanus, pertussis and poliomyelitis (inactivated) vaccine (adsorbed).....	657	Hexobarbital.....	1722
Haemophilus type b conjugate vaccine.....	662	<i>Hexobarbitalum</i>	1722

<i>Halofantrini hydrochloridum</i>	1705	Hexylresorcinol.....	1723
Haloperidol.....	1706	<i>Hexylresorcinolum</i>	1723
Haloperidol decanoate.....	1708	<i>Hibisci sabdariffae flos</i>	2376
<i>Haloperidoli decanoas</i>	1708	Highly purified water	2695
<i>Haloperidolum</i>	1706	Histamine (2.6.10.).....	153
Halothane	1709	Histamine dihydrochloride	1724
<i>Halothanum</i>	1709	Histamine phosphate	1725
<i>Hamamelidis folium</i>	1711	<i>Histamini dihydrochloridum</i>	1724
Hamamelis leaf	1711	<i>Histamini phosphas</i>	1725
Hard capsules.....	600	Histidine	1726
Hard fat	1711	Histidine hydrochloride monohydrate	1727
Hard paraffin.....	2186	<i>Histidini hydrochloridum monohydricum</i>	1727
<i>Harpagophyti radix</i>	1401	<i>Histidinum</i>	1726
Hawthorn berries	1712	Homatropine hydrobromide	1728
Hawthorn leaf and flower	1713	Homatropine methylbromide	1729
Hawthorn leaf and flower dry extract	1714	<i>Homatropini hydrobromidum</i>	1728
Heavy bismuth subnitrate.....	1107	<i>Homatropini methylbromidum</i>	1729
Heavy kaolin.....	1869	Homoeopathic preparations.....	893
Heavy magnesium carbonate	1954	Homoeopathic preparations, arsenious trioxide for	895
Heavy magnesium oxide.....	1958	Homoeopathic preparations, common stinging nettle for	895
Heavy metals (2.4.8.)	104	Homoeopathic preparations, copper for	896
Heavy metals in herbal drugs and fatty oils (2.4.27.).....	119	Homoeopathic preparations, garlic for	897
<i>Helianthi annui oleum raffinatum</i>	2524	Homoeopathic preparations, herbal drugs for	893
<i>Heparina massae molecularis minoris</i>	1717	Homoeopathic preparations, honey bee for.....	898
Heparin, assay of (2.7.5.)	195	Homoeopathic preparations, hypericum for	898
Heparin calcium	1715	Homoeopathic preparations, iron for	899
Heparin in coagulation factors, assay of (2.7.12.).....	204	Homoeopathic preparations, mother tinctures for.....	894
Heparins, low-molecular-mass	1717	Homoeopathic preparations, saffron for	900
Heparin sodium	1716	Honey bee for homoeopathic preparations.....	898
<i>Heparinum calcicum</i>	1715	Hop strobile	1730
<i>Heparinum natricum</i>	1716	Human albumin injection, iodinated (¹²⁵ I).....	827
Hepatitis A immunoglobulin, human	1741	Human albumin solution	1731
Hepatitis A (inactivated) and hepatitis B (rDNA) vaccine (adsorbed).....	664	Human anti-D immunoglobulin	1732
Hepatitis A vaccine, assay of (2.7.14.).....	207	Human anti-D immunoglobulin, assay of (2.7.13.).....	205
Hepatitis A vaccine (inactivated, adsorbed)	665	Human anti-D immunoglobulin for intravenous administration	1733
Hepatitis A vaccine (inactivated, virosome)	667	Human antithrombin III, assay of (2.7.17.).....	209
Hepatitis B immunoglobulin for intravenous administration, human	1741	Human antithrombin III concentrate	1733
Hepatitis B immunoglobulin, human	1741	Human coagulation factor II, assay of (2.7.18.).....	209
Hepatitis B (rDNA), diphtheria and tetanus vaccine (adsorbed).....	641	Human coagulation factor IX.....	1738
Hepatitis B (rDNA), diphtheria, tetanus and pertussis (acellular, component) vaccine (adsorbed)	647	Human coagulation factor IX, assay of (2.7.11.).....	204
Hepatitis B vaccine (rDNA).....	670	Human coagulation factor VII	1734
Hepatitis B vaccine (rDNA), assay of (2.7.15.)	207	Human coagulation factor VII, assay of (2.7.10.).....	203
Hepatitis C virus (HCV), validation of nucleic acid amplification techniques for the detection of HCV RNA in plasma pools: Guidelines.....	176	Human coagulation factor VIII.....	1736
Heptaminol hydrochloride.....	1719	Human coagulation factor VIII, assay of (2.7.4.).....	194
<i>Heptaminoli hydrochloridum</i>	1719	Human coagulation factor VIII (rDNA).....	1737
Herbal drug preparations.....	572	Human coagulation factor X, assay of (2.7.19.).....	210
Herbal drugs	572	Human coagulation factor XI.....	1739
Herbal drugs and fatty oils, heavy metals in (2.4.27.).....	119	Human coagulation factor XI, assay of (2.7.22.)	212
Herbal drugs, determination of tannins (2.8.14.)	221	Human fibrinogen.....	1740
Herbal drugs for homoeopathic preparations	893	Human hepatitis A immunoglobulin	1741
Herbal teas.....	573	Human hepatitis B immunoglobulin	1741
Hexamidine diisetionate	1720	Human hepatitis B immunoglobulin for intravenous administration	1741
		Human insulin	1800
		Human measles immunoglobulin.....	1742
		Human normal immunoglobulin.....	1742
		Human normal immunoglobulin for intravenous administration	1744
		Human plasma for fractionation.....	1746
		Human plasma (pooled and treated for virus inactivation)	1747

Human prothrombin complex.....	1748	<i>Hypericum perforatum</i>

INDEX

To aid users the index includes a reference to the supplement where the latest version of a text can be found.

For example: Acetone.....5.1-2875

means the monograph Acetone can be found on page 2875 of Supplement 5.1.

Note that where no reference for a supplement is made, the text can be found in the principal volume.

Numerics

1.1. General statements	5	2.2.56. Amino acid analysis	86
1.2. Other provisions applying to general chapters and monographs	5	2.2.5. Relative density	27
1.3. General chapters	6	2.2.6. Refractive index	28
1.4. Monographs	7	2.2.7. Optical rotation	28
1.5. Abbreviations and symbols	9	2.2.8. Viscosity	29
1.6. Units of the International System (SI) used in the Pharmacopoeia and equivalence with other units	10	2.2.9. Capillary viscometer method	29
1.8-Cineole in essential oils, assay of (2.8.11.)	216	2.2. Physical and physicochemical methods	23
1. General notices	5	2.3.1. Identification reactions of ions and functional groups	95
2.1.1. Droppers	17	2.3.2. Identification of fatty oils by thin-layer chromatography	98

4-Aminobenzoic acid	973	Acesulfame potassium	911
4. Reagents	321	<i>Acesulfamum kalicum</i>	911
5.10. Control of impurities in substances for pharmaceutical use	559	Acetazolamide	912
5.11. Characters section in monographs	565	<i>Acetazolamidum</i>	912
5.1.1. Methods of preparation of sterile products	445	Acetic acid, glacial	913
5.1.2. Biological indicators of sterilisation	447	Acetic acid in synthetic peptides (2.5.34.)	141
5.1.3. Efficacy of antimicrobial preservation	447	Acetone	5.1-2875
5.1.4. Microbiological quality of pharmaceutical preparations	449	<i>Acetonum</i>	5.1-2875
5.1.5. Application of the F_0 concept to steam sterilisation of aqueous preparations	5.1-2821	Acetylcholine chloride	914
5.1. General texts on sterility	445	<i>Acetylcholini chloridum</i>	914
5.2.1. Terminology used in monographs on vaccines	453	Acetylcysteine	915
5.2.2. Chicken flocks free from specified pathogens for the production and quality control of vaccines	5.1-2825	<i>Acetylcysteinum</i>	915
5.2.3. Cell substrates for the production of vaccines for human use	455	Acetylsalicylic acid	917
5.2.4. Cell cultures for the production of veterinary vaccines	458	Acetyltryptophan, <i>N</i> -	918
		Acetyltyrosine, <i>N</i> -	920
		Aciclovir	921
		<i>Aciclovirum</i>	921
		<i>Acidum 4-aminobenzoicum</i>	973

Bilberry fruit, fresh	1099	<i>Budesonidum</i>	1128
Biological assays (2.7.)	187	Bufexamac	1130
Biological assays and tests, statistical analysis of (5.3.)	475	<i>Bufexamacum</i>	1130
Biological indicators of sterilisation (5.1.2.)	447	Buffer solutions (4.1.3.)	430
Biological tests (2.6.)	145	Buflomedil hydrochloride	1131
Biotin	1100	<i>Buflomedili hydrochloridum</i>	1131
<i>Biotinum</i>	1100		
Biperiden hydrochloride	1101		
<i>Biperideni hydrochloridum</i>	1101		
Biphasic insulin injection	1802		
Biphasic isophane insulin injection	1803		
Birch leaf	1103		
Bisacodyl	1104		
<i>Bisacodylum</i>	1104		

Bumetanide	1132	Calcium in adsorbed vaccines (2.5.14.)	131
<i>Bumetanidum</i>	1132	Calcium lactate, anhydrous	5.1 -2894
Bupivacaine hydrochloride	1133	Calcium lactate monohydrate	5.1 -2895
<i>Bupivacaini hydrochloridum</i>	1133	Calcium lactate pentahydrate	5.1 -2896
Buprenorphine	1135	Calcium lactate trihydrate	5.1 -2897
Buprenorphine hydrochloride	1136	Calcium levofolinate pentahydrate	1163
<i>Buprenorphini hydrochloridum</i>	1136	Calcium levulinate dihydrate	1165
<i>Buprenorphinum</i>	1135	Calcium pantothenate	1166
Buserelin	1137	Calcium phosphate	1167
<i>Buserelinum</i>	1137	Calcium stearate	1167
Busulfan	1138	Calcium sulphate dihydrate	1169
<i>Busulfanum</i>	1138	<i>Calendulae flos</i>	1169
Butcher's broom	1138	<i>Calendula flower</i>	1169
Butylhydroxyanisole	1141	Calf coronavirus diarrhoea vaccine (inactivated)	736
<i>Butylhydroxyanisolum</i>	1141	Calf rotavirus diarrhoea vaccine (inactivated)	737
Butylhydroxytoluene	1141	Calicivirus vaccine (inactivated), feline	757
<i>Butylhydroxytoluenum</i>	1141	Calicivirus vaccine (live), feline, freeze-dried	758
<i>Butylis parahydroxybenzoas</i>	1140	<i>Camphora racemica</i>	1172
Butyl parahydroxybenzoate	1140	Camphor, D-	1170
C		Camphor, racemic	1172
Cachets	601	Canine adenovirus vaccine (inactivated)	738
Caffeine	1145	Canine adenovirus vaccine (live)	738
Caffeine monohydrate	1146	Canine distemper vaccine (live), freeze-dried	740
Calcifediol	1147	Canine leptospirosis vaccine (inactivated)	740
<i>Calcifediolum</i>	1147	Canine parainfluenza virus vaccine (live)	742
<i>Calcii acetat</i>	5.1 -2893	Canine parvovirus vaccine (inactivated)	743
<i>Calcii ascorbas</i>	1150	Canine parvovirus vaccine (live)	744
<i>Calcii carbonas</i>	5.1 -2894	Cape aloes	948
<i>Calcii chloridum dihydricum</i>	1152	Capillary electrophoresis (2.2.47.)	74
<i>Calcii chloridum hexahydricum</i>	1153	Capillary viscometer method (2.2.9.)	29
<i>Calcii dobesilas monohydricum</i>	1153	Caprylic acid	1172
<i>Calcii folinas</i>	1154	Caprylocaproyl macrogolglycerides	1173
<i>Calcii glucoheptonas</i>	1156	<i>Capsici fructus</i>	1174

Sodium methyl parahydroxybenzoate.....	2441	Sorbitan oleate	2468
Sodium molybdate dihydrate	2442		
Sodium nitrite.....	2443		
Sodium nitroprusside	2443		

Sorbitan palmitate	2468	Stearoyl macroglycerides	2491
Sorbitan sesquioleate.....	2468	Stearyl alcohol.....	2492
Sorbitan stearate.....	2469	Sterile braided silk suture in distributor for veterinary use	887
Sorbitan trioleate	2469	Sterile catgut.....	873
Sorbitol.....	2470	Sterile catgut in distributor for veterinary use	885
Sorbitol, liquid (crystallising).....	2471	Sterile containers of plasticised poly (vinyl chloride) for human blood containing anticoagulant solution (3.2.5.)	312
Sorbitol, liquid (non-crystallising).....	2472	Sterile linen thread in distributor for veterinary use.....	886
Sorbitol, liquid, partially dehydrated.....	2473	Sterile non-absorbable strands in distributor for veterinary use	888
<i>Sorbitolum</i>	2470	Sterile non-absorbable sutures	874
<i>Sorbitolum liquidum cristallisabile</i>	2471	Sterile plastic containers for human blood and blood components (3.2.3.).....	309
<i>Sorbitolum liquidum non cristallisabile</i>	2472	Sterile polyamide 6/6 suture in distributor for veterinary use	887
<i>Sorbitolum liquidum partim deshydricum</i>	2473	Sterile polyamide 6 suture in distributor for veterinary use	886
Sotalol hydrochloride	2474	Sterile poly(ethylene terephthalate) suture in distributor for veterinary use	887
<i>Sotaloli hydrochloridum</i>	2474	Sterile products, methods of preparation (5.1.1.).....	445
Soya-bean oil, hydrogenated.....	2475	Sterile single-use plastic syringes (3.2.8.).....	314
Soya-bean oil, refined.....	2476	Sterile synthetic absorbable braided sutures	878
Specific surface area by air permeability (2.9.14.).....	239	Sterile synthetic absorbable monofilament sutures.....	880
Specific surface area by gas adsorption (2.9.26.)	5.1-2811	Sterilisation procedures, biological indicators (5.1.2.)	447
Spectinomycin hydrochloride.....	2476	Sterility (2.6.1.).....	145
<i>Spectinomycini hydrochloridum</i>	2476	Sterols in fatty oils (2.4.23.).....	5.1-2787
Spectrometry, atomic absorption (2.2.23.).....	36	Sticks	626
Spectrometry, atomic emission (2.2.22.).....	35	Sticks, nasal.....	611
Spectrometry, mass (2.2.43.).....	65	St. John's wort.....	2485
Spectrometry, nuclear magnetic resonance (2.2.33.)	51	Stomata and stomatal index (2.8.3.).....	215
Spectrometry, Raman (2.2.48.).....	79	<i>Stramonii folium</i>	2492
Spectrometry, X-ray fluorescence (2.2.37.).....	56	<i>Stramonii pulvis normatus</i>	2494
Spectrophotometry, infrared absorption (2.2.24.).....	37	Stramonium leaf.....	2492
Spectrophotometry, near-infrared (2.2.40.).....	59	Stramonium, prepared	2494
Spectrophotometry, ultraviolet and visible absorption (2.2.25.).....	38	Strands, sterile non-absorbable, in distributor for veterinary use	888
SPF chicken flocks for the production and quality control of vaccines (5.2.2.).....	5.1-2825	Streptokinase bulk solution	2495
Spiramycin.....	5.1-3010	<i>Streptokinasi solutio ad praeparationem</i>	2495
<i>Spiramycinum</i>	5.1-3010	<i>Streptomycini sulfas</i>	2496
Spirapril hydrochloride monohydrate.....	2480	Streptomycin sulphate	2496
<i>Spiraprii hydrochloridum monohydricum</i>	2480	<i>Strontii (⁸⁹Sr) chloridi solutio iniectabilis</i>	850
Spirolactone	2482	Strontium (⁸⁹ Sr) chloride injection	850
<i>Spirolactonum</i>	2482	<i>Styli</i>	626
Spot-on preparations.....	631	Sublingual tablets and buccal tablets	613
Sprays	631	Substances for pharmaceutical use	586
Squalane	2483	Substances for pharmaceutical use, control of impurities (5.10.).....	559
<i>Squalanum</i>	2483	Substances of animal origin for the production of veterinary vaccines (5.2.5.).....	460
Standard solutions for limit tests (4.1.2.)	426	Sub-visible particles, particulate contamination (2.9.19.) ..	253
Standard solutions for limit tests (4.1.2.)	5.1-2818	Succinylsulfathiazole	2498
<i>Stanni colloidalis et technetii (^{99m}Tc) solutio iniectabilis</i>	853	<i>Succinylsulfathiazolum</i>	2498
<i>Stanni pyrophosphatis et technetii (^{99m}Tc) solutio iniectabilis</i>	865	Sucrose.....	2499
<i>Stannosi chloridum dihydricum</i>	2486	Sufentanil	2501
Stannous chloride dihydrate	2486	Sufentanil citrate	2502
Stanozolol.....	2486	<i>Sufentanili citras</i>	2502
<i>Stanozololum</i>	2486	<i>Sufentanilum</i>	2501
Star anise	2487	Sugars, lead in (2.4.10.).....	107
Star anise oil	2488	Sugar spheres	2503
Starch glycolate (type A), sodium	2450	Sulfacetamide sodium.....	2504
Starch glycolate (type B), sodium	2451	<i>Sulfacetamidum natricum</i>	2504
Starch glycolate (type C), sodium	2451	Sulfadiazine.....	2505
Starch, maize	5.1-2965	<i>Sulfadiazinum</i>	2505
Starch, potato	2288	Sulfadimidine	2506
Starch, pregelatinised	2490	<i>Sulfadimidinum</i>	2506
Starch, rice	2369	Sulfadoxine.....	2507
Starch, wheat.....	2698	<i>Sulfadoxinum</i>	2507
Statistical analysis of results of biological assays and tests (5.3.).....	475		
Stavudine.....	5.1-3012		
<i>Stavudinum</i>	5.1-3012		
Steam sterilisation of aqueous preparations, application of the <i>F</i> ₀ concept (5.1.5.).....	5.1-2821		
Stearic acid.....	2490		

Sulfafurazole.....	2508	Tablets, dispersible.....	628
<i>Sulfafurazolum</i>	2508	Tablets, effervescent.....	627
Sulfaguanidine.....	2508	Tablets for use in the mouth.....	628
<i>Sulfaguanidinum</i>	2508	Tablets for vaginal solutions and suspensions.....	630
Sulfamerazine.....	2509	Tablets, gastro-resistant.....	628
<i>Sulfamerazinum</i>	2509	Tablets, modified-release.....	628
Sulfamethizole.....	2510	Tablets, orodispersible.....	628
<i>Sulfamethizolum</i>	2510	Tablets, resistance to crushing (2.9.8.).....	235
Sulfamethoxazole.....	2511	Tablets, soluble.....	628
<i>Sulfamethoxazolum</i>	2511	Tablets, sublingual.....	613
Sulfamethoxy pyridazine for veterinary use.....	2512	Tablets, uncoated.....	627
<i>Sulfamethoxy pyridazinum ad usum veterinarium</i>	2512	Tablets, uncoated, friability of (2.9.7.).....	234
Sulfanilamide.....	2513	Tablets, vaginal.....	629
<i>Sulfanilamidum</i>	2513	Talc.....	5.1-3017
Sulfasalazine.....	2514	<i>Talcum</i>	5.1-3017
<i>Sulfasalazinum</i>	2514	Tamoxifen citrate.....	5.1-3018
Sulfathiazole.....	2516	<i>Tamoxifeni citras</i>	5.1-3018
<i>Sulfathiazolum</i>	2516	<i>Tamponae medicatae</i>	628
Sulfinpyrazone.....	2517	Tampons, ear.....	602
<i>Sulfinpyrazonum</i>	2517	Tampons, medicated.....	628

Uniformity of content of single-dose preparations (2.9.6.)	234
Uniformity of mass of delivered doses from multidose containers (2.9.27.).....	263
Uniformity of mass of single-dose preparations (2.9.5.)	233
Units of the International System (SI) used in the Pharmacopoeia and equivalence with other units (1.6.) ...	10
Unsaponifiable matter (2.5.7.).....	129
Urea.....	2658

<i>Ureum</i>	2658	<i>Vaccinum clostridii septici ad usum veterinarium</i>	749
<i>Urofollitropin</i>	2659	<i>Vaccinum colibacillosis fetus a partu recentis inactivatum ad ruminantes</i>	778
<i>Urofollitropinum</i>	2659	<i>Vaccinum colibacillosis fetus a partu recentis inactivatum ad suem</i>	776
<i>Urokinase</i>	2661	<i>Vaccinum diarrhoeae viralis bovinae inactivatum</i>	734
<i>Uronic acids in polysaccharide vaccines (2.5.22.)</i>	133	<i>Vaccinum diphtheriae adsorbatum</i>	660
<i>Ursodeoxycholic acid</i>	2662	<i>Vaccinum diphtheriae adulti et adolescentis adsorbatum</i>	661
<i>Urtica dioica ad praeparationes homoeopathicas</i>	895	<i>Vaccinum diphtheriae et tetani adsorbatum</i>	639
<i>Urticae folium</i>	5.1-2980	<i>Vaccinum diphtheriae et tetani adulti et adolescentis adsorbatum</i>	639
<i>Uvae ursi folium</i>	1054	<i>Vaccinum diphtheriae, tetani et hepatitis B (ADNr) adsorbatum</i>	641
V		<i>Vaccinum diphtheriae, tetani et pertussis adsorbatum</i> ..	643
<i>Vaccina ad usum humanum</i>	5.1-2835	<i>Vaccinum diphtheriae, tetani et pertussis sine cellulis ex elementis praeparatum adsorbatum</i>	642
<i>Vaccina ad usum veterinarium</i>	590	<i>Vaccinum diphtheriae, tetani, pertussis et poliomyelitidis inactivatum adsorbatum</i>	656
<i>Vaccines, adsorbed, aluminium in (2.5.13.)</i>	131	<i>Vaccinum diphtheriae, tetani, pertussis, poliomyelitidis inactivatum et haemophili stirpe b coniugatum adsorbatum</i>	657
<i>Vaccines, adsorbed, calcium in (2.5.14.)</i>	131	<i>Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum et haemophili stirpe b coniugatum adsorbatum</i>	645
<i>Vaccines and immunosera, phenol in (2.5.15.)</i>	131	<i>Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum et hepatitis B (ADNr) adsorbatum</i>	647
<i>Vaccines and immunosera, veterinary, evaluation of efficacy (5.2.7.)</i>	5.1-2829	<i>Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum et poliomyelitidis inactivatum adsorbatum</i>	648
<i>Vaccines and immunosera, veterinary, evaluation of safety (5.2.6.)</i>	5.1-2827	<i>Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum, hepatitis B (ADNr), poliomyelitidis inactivatum et haemophili stirpe b coniugatum adsorbatum</i>	650
<i>Vaccines and immunosera, veterinary, evaluation of the safety of each batch (5.2.9.)</i>	5.1-2830	<i>Vaccinum diphtheriae, tetani, pertussis sine cellulis ex elementis praeparatum poliomyelitidis inactivatum et haemophili stirpe b coniugatum adsorbatum</i>	653
<i>Vaccines for human use</i>	5.1-2835	<i>Vaccinum encephalitis ixodibus advectae inactivatum</i>	703
<i>Vaccines for human use, cell substrates for the production of (5.2.3.)</i>	455	<i>Vaccinum encephalomyelitis infectivae aviariae vivum</i>	725
<i>Vaccines for human use, viral, extraneous agents in (2.6.16.)</i>	169	<i>Vaccinum erysipellatis suillae inactivatum</i>	793
<i>Vaccines for veterinary use</i>	590	<i>Vaccinum febris flavae vivum</i>	5.1-2852
<i>Vaccines, polysaccharide, hexosamines in (2.5.20.)</i>	132	<i>Vaccinum febris typhoidi</i>	707
<i>Vaccines, polysaccharide, methylpentoses in (2.5.21.)</i>	133	<i>Vaccinum febris typhoidi cryodesiccatum</i>	707
<i>Vaccines, polysaccharide, nucleic acids in (2.5.17.)</i>	132	<i>Vaccinum febris typhoidis polysaccharidicum</i>	705
<i>Vaccines, polysaccharide, O-acetyl in (2.5.19.)</i>	132	<i>Vaccinum febris typhoidis vivum perorale (stirpe Ty 21a)</i>	708
<i>Vaccines, polysaccharide, phosphorus in (2.5.18.)</i>	132	<i>Vaccinum furunculosis ad salmonidas inactivatum cum adiuvatione oleosa ad iniectionem</i>	767
<i>Vaccines, polysaccharide, protein in (2.5.16.)</i>	131	<i>Vaccinum haemophili stirpe b coniugatum</i>	662
<i>Vaccines, polysaccharide, ribose in (2.5.31.)</i>	137	<i>Vaccinum hepatitis A inactivatum adsorbatum</i>	665
<i>Vaccines, polysaccharide, sialic acid in (2.5.23.)</i>	133	<i>Vaccinum hepatitis A inactivatum et hepatitis B (ADNr) adsorbatum</i>	664
<i>Vaccines, polysaccharide, uronic acids in (2.5.22.)</i>	133	<i>Vaccinum hepatitis A inactivatum virosomale</i>	667
<i>Vaccines, SPF chicken flocks for the production and quality control of (5.2.2.)</i>	5.1-2825	<i>Vaccinum hepatitis B (ADNr)</i>	670
<i>Vaccines, terminology (5.2.1.)</i>	453	<i>Vaccinum hepatitis viralis anatis stirpe I vivum</i>	751
<i>Vaccines, veterinary, cell cultures for the production of (5.2.4.)</i>	458	<i>Vaccinum herpesvirus equini inactivatum</i>	754
<i>Vaccines, veterinary, substances of animal origin for the production of (5.2.5.)</i>	460	<i>Vaccinum inactivatum diarrhoeae vituli coronavirum illatae</i>	736
<i>Vaccines, viral live, test for neurovirulence (2.6.18.)</i>	172	<i>Vaccinum inactivatum diarrhoeae vituli rotavirus illatae</i>	737
<i>Vaccinum actinobacillosis inactivatum ad suem</i>	784	<i>Vaccinum influenzae equi inactivatum</i>	755
<i>Vaccinum adenovirus caninae vivum</i>	738	<i>Vaccinum influenzae inactivatum ad suem</i>	785
<i>Vaccinum adenovirus caninae inactivatum</i>	738	<i>Vaccinum influenzae inactivatum ex corticis antigeniis praeparatum</i>	673
<i>Vaccinum anaemiae infectivae pulli vivum</i>	769	<i>Vaccinum influenzae inactivatum ex corticis antigeniis praeparatum virosomale</i>	674
<i>Vaccinum anthracis vivum ad usum veterinarium</i>	715		
<i>Vaccinum aphtharum epizooticarum inactivatum ad ruminantes</i>	5.1-2860		
<i>Vaccinum bronchitis infectivae aviariae inactivatum</i>	718		
<i>Vaccinum bronchitis infectivae aviariae vivum</i>	720		
<i>Vaccinum brucellosis (Brucella melitensis stirpe Rev. 1) vivum cryodesiccatum ad usum veterinarium</i>	5.1-2859		
<i>Vaccinum bursitis infectivae aviariae inactivatum</i>	722		
<i>Vaccinum bursitis infectivae aviariae vivum</i>	723		
<i>Vaccinum calicivirus felinae inactivatum</i>	757		
<i>Vaccinum calicivirus felinae vivum cryodesiccatum</i> ..	758		
<i>Vaccinum cholerae</i>	637		
<i>Vaccinum cholerae aviariae inactivatum</i>	5.1-2861		
<i>Vaccinum cholerae cryodesiccatum</i>	638		
<i>Vaccinum clostridii botulini ad usum veterinarium</i>	745		
<i>Vaccinum clostridii chauvoei ad usum veterinarium</i>	745		
<i>Vaccinum clostridii novyi B ad usum veterinarium</i>	746		
<i>Vaccinum clostridii perfringentis ad usum veterinarium</i>	747		

<i>Vaccinum influenzae inactivatum ex viris integris praeparatum</i>	676	<i>Vaccinum variolae gallinae vivum</i>	766
<i>Vaccinum influenzae inactivatum ex virorum fragmentis praeparatum</i>	671	<i>Vaccinum vibriosidis ad salmonidas inactivatum</i>	797
<i>Vaccinum laryngotracheitidis infectivae aviariae vivum</i>	727	<i>Vaccinum vibriosidis aquae frigidae inactivatum ad salmonidas</i>	796
<i>Vaccinum leptospirosis boviniae inactivatum</i>	730	<i>Vaccinum viri syncytialis meatus spiritus bovini vivum cryodesiccatum</i>	733
<i>Vaccinum leptospirosis caninae inactivatum</i>	740	Vaginal capsules	629
<i>Vaccinum leucosis felinae inactivatum</i>	761	Vaginal foams	630
<i>Vaccinum mannheimiae inactivatum ad bovidas</i>	771	<i>Vaginalia</i>	629
<i>Vaccinum mannheimiae inactivatum ad ovem</i>	772	Vaginal preparations	629
<i>Vaccinum meningococcale classis C coniugatum</i>	680	Vaginal preparations, semi-solid	630
<i>Vaccinum meningococcale polysaccharidicum</i>	682	Vaginal solutions and suspensions, tablets for.....	630
<i>Vaccinum morbi Aujeszkyi ad suem inactivatum</i>	715	Vaginal solutions, emulsions and suspensions.....	630
<i>Vaccinum morbi Aujeszkyi ad suem vivum cryodesiccatum ad usum parenterale</i>	717	Vaginal tablets	629
<i>Vaccinum morbi Carrei vivum cryodesiccatum ad canem</i>	740	Vaginal tampons, medicated.....	630
<i>Vaccinum morbi Carrei vivum cryodesiccatum ad mustelidas</i>	751	<i>Valerianae radix</i>	2667
<i>Vaccinum morbillorum, parotitidis et rubellae vivum</i>	678	Valerian root.....	2667
<i>Vaccinum morbillorum vivum</i>	679	Validation of nucleic acid amplification techniques for the detection of hepatitis C virus (HCV) RNA in plasma pools: Guidelines.....	176
<i>Vaccinum morbi Marek vivum</i>	774	Valine	2668
<i>Vaccinum morbi partus diminutionis MCMLXXVI inactivatum ad pullum</i>	753	<i>Valinum</i>	2668
<i>Vaccinum myxomatosis vivum ad cuniculum</i>	775	Valproic acid.....	2669
<i>Vaccinum panleucopeniae felinae infectivae inactivatum</i>	759	Vancomycin hydrochloride	2670
<i>Vaccinum panleucopeniae felinae infectivae vivum</i>	760	<i>Vancomycini hydrochloridum</i>	2670
<i>Vaccinum parainfluenzae viri bovini vivum cryodesiccatum</i>	732	Vanillin	2672
<i>Vaccinum parainfluenzae viri canini vivum</i>	742	<i>Vanillinum</i>	2672
<i>Vaccinum paramyxovirus 3 aviarii inactivatum</i>	728	Varicella immunoglobulin for intravenous administration, human	1753
<i>Vaccinum parotitidis vivum</i>	684	Varicella immunoglobulin, human	1752
<i>Vaccinum parvovirus caninae inactivatum</i>	743	Varicella vaccine (live).....	709
<i>Vaccinum parvovirus caninae vivum</i>	744	<i>Vaselinum album</i>	2187
<i>Vaccinum parvovirus inactivatum ad suem</i>	787	<i>Vaselinum flavum</i>	2188
